

DESCRIPTION

PT2579 is a Radio Data System Demodulator IC utilizing CMOS Technology specially designed for radio data system applications. The RDS data signal (RDDA) and the RDS clock signal (RDCL) are provided as outputs for further processing by an ideal decoder / microcontroller. Anti-aliasing Filter (2nd order), 57KHz band pass filter (8th order), reconstruction filter (2nd order), clocked comparator with automatic offset compensation, biphase symbol decoder, differential decoder, and signal quality detector are all built into a single chip having the highest performance and reliability. Pin assignments and application circuit are optimized for easy PCB layout and cost saving advantages.

FEATURES

- CMOS technology
- Low power consumption
- Anti-Aliasing filter (2nd Order)
- Reconstruction filter (2nd Order)
- 57KHz Band-Pass filter (8th Order)
- 57KHz carrier regeneration
- Differential decoder
- Signal quality detector
- Subcarrier output
- Selectable 4.332 / 8.664MHz Crystal Oscillator with variable dividers
- Synchronous demodulator for 57KHz Modulated RDS signals
- Clocked comparator with automatic offset compensation
- Clock generation with Lock on Biphase data rate
- Biphase symbol decoder with integrate and dump functions
- Available in 16 pins, DIP or SOP

APPLICATIONS

- Car radio
- Home stereo tuner

BLOCK DIAGRAM

PIN CONFIGURATION

PIN DESCRIPTION

Pin Name	I/O	Description	Pin No.
QUAL	O	Quality indicator output pin	1
RDDA	O	RDS data output pin	2
VREF	-	Reference voltage	3
MUX	I	Multiplex signal input pin	4
AVDD	-	Analog supply voltage (+5V)	5
AVSS	-	Analog ground pin (0V)	6
CIN	I	Subcarrier input pin to the comparator	7
SCOUT	O	Reconstruction filter subcarrier output pin	8
MODE	I	Oscillator mode / test control input pin	9
TEST	I	Test pin	10
DVSS	-	Digital ground pin (0V)	11
DVDD	-	Digital supply voltage (+5V)	12
OSC1	I	Oscillator input pin	13
OSC2	O	Oscillator output pin	14
T57	O	57KHz clock signal output pin	15
RDCL	O	RDS clock output pin	16

FUNCTION DESCRIPTION

PT2579 is a demodulator chip specially designed for radio data system applications. It provides 57KHz bandpass filter and a digital demodulator to regenerate the RDS data stream out of the multiplex signal (MPX). PT2579 consists of the Filter and Digital Sections.

FILTER SECTION

The MUX Signal is band limited by a second order anti-aliasing filter and fed through a 57KHz 8th order bandpass filter with a 3KHz bandwidth. This separates the RDS signals. This filter uses switch capacitor technique and uses a clock frequency of 541.5KHz which is derived from the 4.332/8.664 MHz crystal oscillator. The signal is then fed into the reconstruction filter to smooth the sampled and filtered RDS signal before it is outputted on the SCOUT pin. The signal is AC-coupled to the comparator pin (CIN). The comparator uses a frequency of 228KHz (synchronized by the 57KHz of the demodulator).

DIGITAL SECTION

The Costas Loop Circuit together with the carrier regeneration demodulates the internal coupled digitized signal. The suppressed carrier is recovered from the 2 sidebands (Costas Loop). The demodulated signal is low-pass filtered in such a way that the over all pulse shape (transmitter and receiver) approaches a cosinusoidal form in conjunction with the following integrate and dump circuit.

The data spectrum shaping is divided into two equal parts and handled in the transmitter and in the receiver. Ideally, the data filtering should be equal in both of these parts. The overall data channel spectrum shaping of the transmitter and the receiver is approximately 100% roll off.

The integrate and dump circuit performs an integration over a clock period. This results in a demodulation and valid RDS signal in form of biphase symbols being outputted from the integrate and dump circuit. The final stages of the RDS data processing are the biphase symbol decoding and the differential decoding. After synchronization by the data clock RDCL, data appears on the RDDA output. The output of the biphase symbol decoder is evaluated by a special circuit to provide an indication of good data (QUAL=HIGH) or corrupt data (QUAL=LOW).

RDS Demodulator IC

PT2579

TIMING

The fixed and variable dividers are applied to the 4.332/8.664MHz crystal oscillator to generate the 1.1875KHz RDS Clock – RDCL. The RDCL is synchronized with the incoming data. No matter what clock edge is considered, the data will be valid for a period of 399 μ s after clock transition. The data change timing is 4 μ s before a clock change. Which clock transition (i.e. positive or negative going clock), the data change occurs in, depends on the lock conditions and is arbitrary (bit slip).

When the reception is poor, it is possible that faults in phase occur, then the clock signal stays uninterrupted and data is constant for 1.5 clock periods. Normally, faults in phase do not occur in a cyclic manner. If however, the faults in the phase occur in this way, the minimum spacing between two possible faults in phase depends on the data being transmitted. The minimum spacing cannot be less than 16 clock period. The quality bit changes only at the time of a data change.

The diagram below shows the RDS timing waveform which includes a phase jump.

ABSOLUTE MAXIMUM RATING

Parameter	Symbol	Condition	Min.	Max.	Unit
Analog supply voltage	AV_{DD}	AV_{DD}	0	6	V
Digital supply voltage	DV_{DD}	DV_{DD}	0	6	V
Voltage on all pins except GND	V_n		-0.5	$V_{DDX}+0.5$	V
Operating temperature	T_{opr}		-40	+85	°C
Storage temperature	T_{stg}		-65	+150	°C

		Ta=-40 to +85 °C	-	-	±30	10 ⁻⁶
Load capacitance	CL		-	30	-	pF
Resonance resistance	Rxtal		-	-	60	Ω

Note:

The signal T57 has a phase lead of $123^\circ (\pm 180^\circ)$ relative to ARI carrier at output SCOUT.

RDS Demodulator IC

PT2579

APPLICATION CIRCUIT

Note:

Two crystal frequencies may be used via the MODE pin. Please refer to the table below.

For the 4.332MHz Crystal, it is recommended to use TXC 6A04300098 or a component with the same specifications.

MODE Pin State	Crystal Clock Frequency (MHz)
LOW	4.332
HIGH	8.664

Notes:

1. All dimensions are in INCHES.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimensions "A", "A1" and "L" are measured with the package seated in JEDEC Seating Plane Gauge GS-3.
4. "D", "D1" and "E1" dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch.
5. "E" and "eA" measured with the leads constrained to be perpendicular to datum -c-.
"eB" and "eC" are measured at the lead tips with the loads unconstrained.
6. "N" is the number of terminal positions. (N=16)
7. Pointed or rounded lead tips are preferred to ease insertion.
8. "b2" and "b3" maximum dimensions are not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25 mm).
9. Distance between leads including Dambar protrusions to be 0.005 inch minimum.
10. Datum plane -H- coincident with the bottom of lead, where lead exits body.
11. Refer to JEDEC MS-001 Variation AB.

Notes:

1. Dimensioning and tolerancing per ANSI Y14.5M-1982.
2. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold Flash, protrusion or gate burrs shall not exceed 0.15 mm (0.006 in) per side.
3. Dimension "E" does not include interlead flash or protrusions. Interlead flash or protrusions shall not exceed 0.25 mm (0.010 in) per side.
4. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
5. "L" is the length of the terminal for soldering to a substrate.
6. N is the number of the terminal positions (N=16)
7. The lead width "B" as measured 0.36 mm (0.014 in) or greater above the seating plane, shall not exceed a maximum value of 0.61 mm (0.024 in).
8. Controlling dimension : MILLIMETER.
9. Refer to JEDEC MS-013, Variation AA.

Note:

1. Dimensioning and tolerancing per ANSI Y 14.5M-1994
 2. Controlling Dimension: MILLIMETERS.
 3. Dimension D does not include mold flash protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15 mm (0.006 in) per end. Dimension E1 does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.25mm per side. D and E1 dimensions are determined at datum H.
 4. The package top may be smaller than the package bottom. Dimensions D and E1 are determined at the outermost extremes of the plastic body exclusive of mold flash, tie bar burrs, gate burrs and interlead flash, but including any mismatch between the top and bottom of the plastic body.
 5. Datums A & B to be determined at datum H.
 6. N is the number of terminal positions. (N=16)
 7. The dimensions apply to the flat section of the lead between 0.10 to 0.25mm from the lead tip.
 8. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.10mm total in excess of the "b" dimension at maximum material condition. The dambar cannot be located on the lower radius of the foot.
 9. This chamfer feature is optional. If it is not present, then a pin 1 identifier must be located within the index area indicated.
 10. Refer to JEDEC MS-012, Variation AC.

Figure 1 is a schematic diagram of a 2D array of microstructures. The array is defined by a width D and a height E . It consists of N columns and $N/2 + 1$ rows of microstructures. A central shaded region is labeled "INDEX AREA ($D/2 \times E1/2$)". The diagram includes various labels (A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z) indicating specific features or dimensions. A detailed view of a single microstructure is shown at the bottom right, labeled "2X".

Technical drawing of a mechanical part in side view. The part features a base with vertical ribs and a top surface with a chamfer. Dimensions A1, A2, and A are indicated. Section lines A-A are shown. A detail view of the chamfer is shown with a symbol for a 1:1 ratio, the text 'eee C', and a section line C-C. A detail view of the base is shown with a symbol for a 1:1 ratio, the text 'ccc C', and a section line C-C. The text 'SEATING PLANE' is labeled on the base. The text 'SIDE VIEW' is centered below the drawing.
