

13-Bit to 26-Bit Registered Buffer

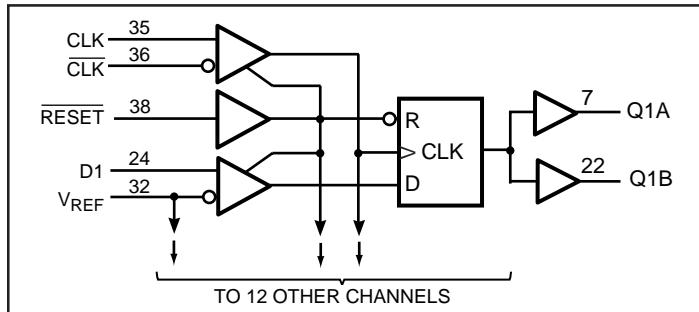

Product Features

- PI74SSTVF16859 is designed for low-voltage operation, 2.5V for PC1600~PC2700; 2.6V for PC3200
- Supports SSTL_2 Class I specifications on outputs
- All Inputs are SSTL_2 Compatible, except RESET which is LVCMOS.
- Designed for DDR Memory
- Flow-Through Architecture
- Packages:
 - 64-pin, 240-mil wide plastic TSSOP (A)
 - 56-pin, Plastic Very Thin Fine Pitch Quad Flat No Lead QFN (ZB)

Logic Block Diagram - TSSOP

Logic Block Diagram - QFN

Product Pin Description

Pin Name	Description
RESET	Reset (Active Low) LVCMOS
CLK	Clock Input, Positive Differential Input
CLKB	Clock Input, Negative Differential Input
D	Data Input, D1-D13
Q	Data Output, Q1-Q13
GND	Ground
V _{DD}	Core Supply Voltage
V _{DDQ}	Output Supply Voltage
V _{REF}	Input Reference Voltage

Product Description

Pericom Semiconductor's PI74SSTVF16859 logic circuit is produced using the Company's advanced sub-micron CMOS technology, achieving industry leading speed.

All inputs are compatible with the JEDEC standard for SSTL_2, except the LVCMOS reset (RESET) input. All outputs are SSTL_2, Class II compatible.

The device operates from a differential clock (CLK and CLKB). Data registered at the crossing of CLK going HIGH, and CLKB going LOW.

The PI74SSTVF16859 supports low-power standby operation. When RESET is LOW, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (V_{REF}) inputs are allowed. In addition, when RESET is LOW, all registers are reset, and all outputs are forced LOW. The LVCMOS RESET input must always be held at a valid logic HIGH or LOW level.

To ensure defined outputs from the register before a stable clock has been supplied, RESET must be held in the LOW state during power up.

In the DDR DIMM application, RESET is specified to be completely asynchronous with respect to CLK and CLKB. Therefore, no timing relationship can be guaranteed between the two. When entering RESET, the register will be cleared and the outputs will be driven LOW quickly, relative to the time to disable the differential input receivers, thus ensuring no glitches on the output. However, when coming out of RESET, the register will become active quickly, relative to the time to enable the differential input receivers. When the data inputs are LOW, and the clock is stable, during the time from the LOW-to-HIGH transition of RESET until the input receivers are fully enabled, the design must ensure that the outputs will remain LOW.

Pericom's PI74SSTVF16859 is characterized for operation from 0°C to 70°C.

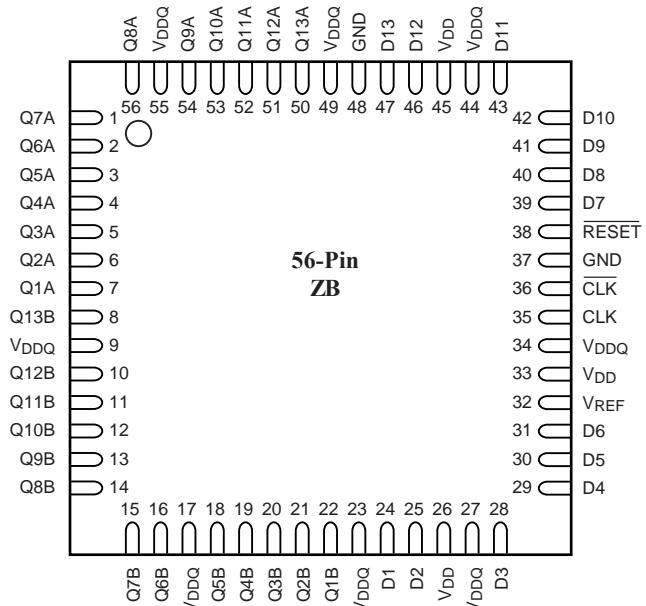

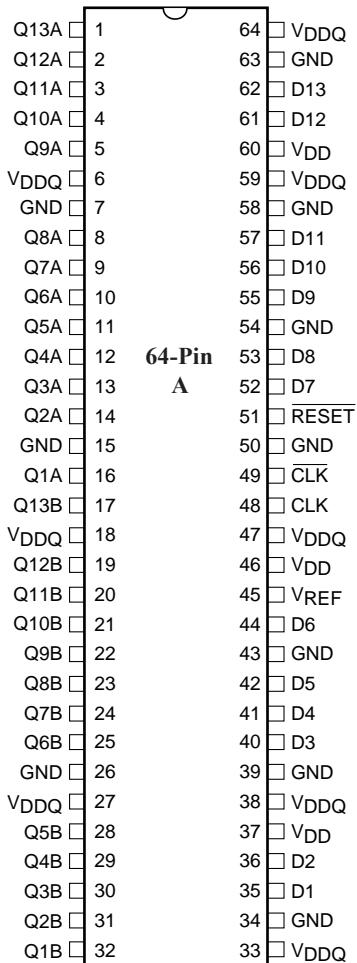

Truth Table⁽¹⁾

Inputs				Outputs
RESET	CLK	CLKB	D	Q
L	X or Floating	X or Floating	X or Floating	L
H	↑	↓	H	H
H	↑	↓	L	L
H	L or H	L or H	X	Q ₀ ⁽²⁾

Notes:

1. H = High Signal Level
L = Low Signal Level
↑ = Transition LOW-to-HIGH
↓ = Transition HIGH-to-LOW
X = Irrelevant or floating
2. Output level before the indicated steady state input conditions were established.

Product Pin Configurations

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

1. The input and output negative voltage ratings may be excluded if the input and output clamp ratings are observed.
2. This value is limited to 3.6V Maximum.
3. The package thermal impedance is calculated in accordance with JESD51.

Maximum Ratings (Above which the useful life may be impaired. For user guidelines, not tested.)

Item	Symbol/ Conditions	Ratings	Units
Storage Temperature	T_{stg}	-65 to 150	°C
Supply Voltage	V_{DD} or V_{DDQ}	-0.5 to 3.6	V
Input Voltage ^(1,2)	V_I	-0.5 to $V_{DD} + 0.5$	
Output Voltage ^(1,2)	V_O	-0.5 to $V_{DDQ} + 0.5$	
Input Clamp Current	I_{IK} , $V_I < 0$ or $V_I > V_{DD}$	±50	mA
Output Clamp Current	I_{OK} , $V_O < 0$ or $V_O > V_{DDQ}$	±50

Parameter Measurement Information

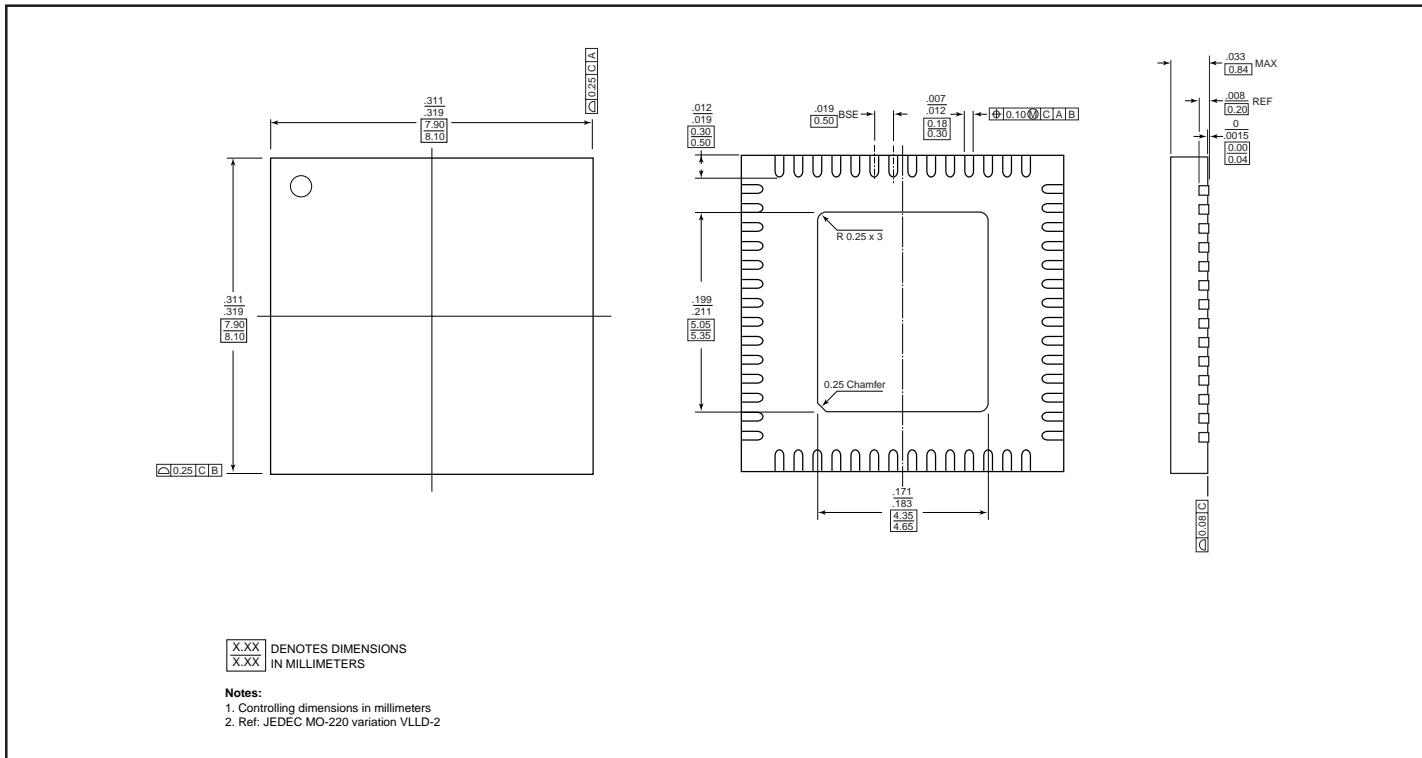

Notes:

8. C_L includes probe and jig capacitance.
9. I_{DD} tested with clock and data inputs held at V_{DD} or GND, and $I_O = 0mA$.
10. All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz, $Z_0 = 50$ ohms.
Input slew rate = $1V/ns \pm 20\%$ (unless otherwise specified).
11. The outputs are measured one at a time with one transition per measurement.
12. $V_{TT} = V_{REF} = V_{DDQ}/2$
13. $V_{IH} = V_{REF} + 310mV$ (ac voltage levels) for SSTL inputs. $V_{IH} = V_{DD}$ for LVCMS input.
14. $V_{IL} = V_{REF} - 310mV$ (ac voltage levels) for SSTL inputs. $V_{IL} = GND$ for LVCMS input.
15. t_{PLH} and t_{PHL} are the same as t_{pd} .
