R_{Compliance}

The value of the compliance resistor, R_{Compliance} sets the USB2.0 signaling rate (frequency) deviation to 1000ppm peak-to-peak (+/-500ppm). It causes a -4dB peak power EMI reduction at the 480MHz fundamental USB2.0 frequency. Higher harmonics are reduced more.

If the R_{Compliance} is set to a lower value than its compliance limit, it will set the USB2.0 signaling rate (frequency) deviation to above 1000ppm peak-to-peak.

For settings above 1000ppm the USB2.0 compliance pass/fail becomes gradually intermittent. USB2.0 functionality is maintained upto 3000ppm peak-to-peak signaling rate (frequency) deviation. The EMI tradeoff in the system is attenuation/compliance. While fully functional (and compliant intermittent) the 2000ppm frequency deviation can provide -7dB of EMI attenuation at the 480MHz fundamental.
