

8-Channel, Programmable T/R Switch for Ultrasound

Check for Samples: [TX810](#)

FEATURES

- Compact T/R Switch for Ultrasound
- Flexible Programmability
 - 8 Bias Current Settings
 - 8 Power/Performance Combinations
 - Easy Power-Up/Down control
- Fast Wake Up Time
- Dual Supply Operation
- Optimized Insertion Loss

APPLICATIONS

- Medical Ultrasound
- Industrial Ultrasound

DESCRIPTION

The TX810 provides an integrated solution for a wide range of ultrasound applications. It is an 8 channel, current programmable, transmit/receive switch in a small 6mm x 6mm package.

The internal diodes limit the output voltage when high voltage transmitter signals are applied to the input. While the insertion loss of TX810 is minimized during receive mode.

Unlike conventional T/R switches, the TX810 contains a 3-bit interface used to program bias current from 7mA to 0mA for different performance and power requirements. When the TX810 bias current is set as 0mA (i.e., high-impedance mode), the device is configured as power-down mode. In the high-impedance mode, TX810 does not add additional load to high-voltage transmitters. In addition, the device can wake up from power-down mode in less than 1μs. With these advanced programmability features, significant power saving can be achieved in systems.

Figure 1. Block Diagram of TX810

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION⁽¹⁾

PACKAGED DEVICES	PACKAGE TYPE	TRANSPORT MEDIA, QUANTITY	OPERATING TEMPERATURE RANGE
TX810IRHHT	S-PVQFN-N36	Tape and Reel, 250	0~70°C
TX810IRHHR		Tape and Reel, 2500	

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

	VALUE	UNIT
Supply Voltage, VD	-0.3 ~ +6	V
Supply Voltage, VP	-0.3 ~ +6	V
Supply Voltage, VN	-6 ~ +0.3	V
Supply Voltage, VB	-0.3 ~ +6	V
Input AC voltage, INn	±100	V
Input at Vsub	-6 ~ +0.3	V
Output current, IO	15	mA
Maximum junction temperature, continuous operation, long term reliability ⁽²⁾ TJ	125°C	
Storage temperature range, Tstg	-55°C to 150°C	
ESD ratings	HBM	500
	CDM	750
	MM	200

- (1) Stresses above those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rated conditions for extended periods may degrade device reliability.
- (2) The absolute maximum junction temperature for continuous operation is limited by the package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device.

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾ (OLFM Airflow Assumed)		TX810	UNITS
		RHH	
		36 PINS	
θ_{JA}	Junction-to-ambient thermal resistance ⁽²⁾	29.7	°C/W
$\theta_{JC(top)}$	Junction-to-case(top) thermal resistance ⁽³⁾	27	
θ_{JB}	Junction-to-board thermal resistance ⁽⁴⁾	7.2	
ψ_{JT}	Junction-to-top characterization parameter ⁽⁵⁾	0.1	
ψ_{JB}	Junction-to-board characterization parameter ⁽⁶⁾	7.2	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case(top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, ψ_{JT} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, ψ_{JB} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA} , using a procedure described in JESD51-2a (sections 6 and 7).

DEVICE INFORMATION

PIN FUNCTIONS

PIN		DESCRIPTION
NUMBER	NAME	
1, 3, 7, 9, 10, 12, 34, 36	IN _n	Inputs for Channel n
16, 18, 19, 21, 25, 27, 28, 30	OUT _n	Outputs for Channel n
33	VD	Logic Supply Voltage; +2.5 V to +5 V; bypass to ground with 0.1 μ F and 10 μ F capacitors
31	VP	Positive Supply Voltage; +5 V; bypass to ground with 0.1 μ F and 10 μ F capacitors
15	VN	Negative Supply Voltage; –5 V; bypass to ground with 0.1 μ F and 10 μ F capacitors
13	VB	Bias voltage; connect to 0 V (GND) for \pm 5 V operation
2, 8, 11, 14, 17, 20, 26, 29, 32, 35	GND	Ground
24	B1	Bit 1; Current program bit
23	B2	Bit 2; Current program bit
22	B3	Bit 3; Current program bit
4, 5, 6	NC	No internal connection.
0	V _{sub}	PowerPAD™ of the package. –5 V to 0 V for \pm 5 V operation. The thermal pad is needed for thermal dissipation.

Figure 12. Bias Current Adjustment Response Time (1mA to 7mA)

THEORY OF OPERATION

A typical ultrasound block diagram is shown in Figure 13.

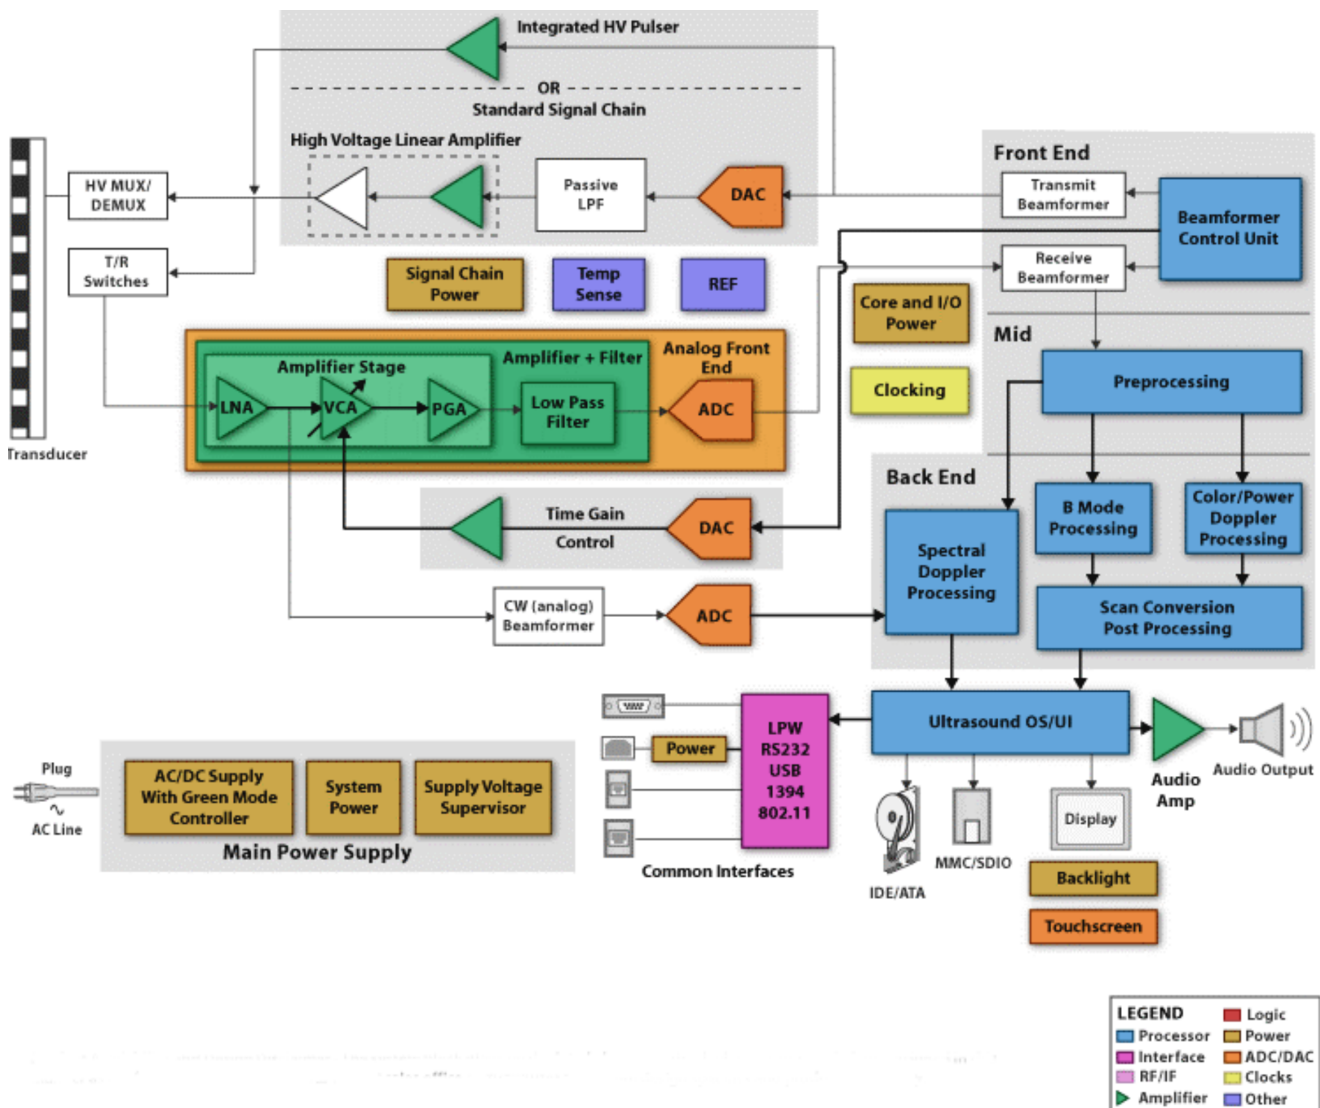

Figure 13. Ultrasound System Block Diagram

A transducer is excited by high voltage pulsers. It converts the electrical energy to mechanical energy. After each excitation, the transducer sends out ultrasonic wave to medium. Partial ultrasonic wave gets reflected by inhomogeneous medium and received by the transducer again, i.e. echo signal. Thus, the transducer is a duplex device on which both high voltage and low voltage signals exist. The transducer can not be connected to amplifier stages directly; otherwise, the high voltage signal can permanently destroy amplifiers. The TX810, i.e. T/R switches, is sitting between integrated HV pulser and low noise amplifier (LNA). The main function of TX810 is to isolate the LNA from high-voltage transmitter. TX810 limits the high voltage pulse and let echo signals reaching amplifier. Therefore, an ideal T/R switch should completely block high voltage signals and maintain all information from echoes.

The detail architecture of the TX810 is listed in Figure 14.

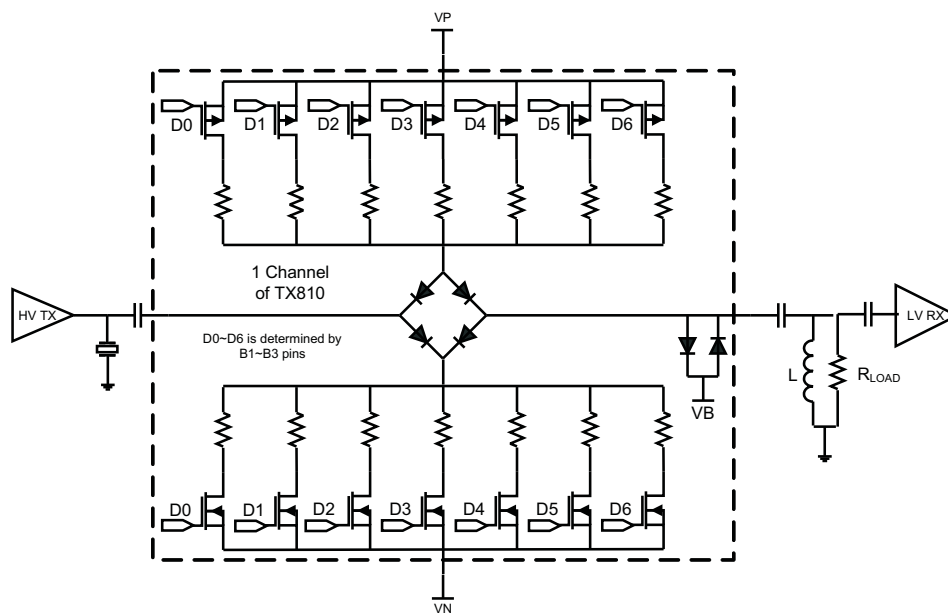

Figure 14. TX810 Block Diagram

TX810 includes four parts: Diode Bridge, bias network, clamp diodes, and logic controller. A decoder is used to convert 3-bit logic (B1 to B3) input to 7 control signals (D0 to D6) for 7 MOSFET switches. +2.5V to +5V logic input is level shifted internally to drive the switches. The bias current of the bridge diode is adjusted proportionally by these switches. When all switches are on, the bias current is 7mA. Each bit difference will adjust the bias current approximately 1mA. When all switches are off, the TX810 enters the power down mode. Comparing to discrete T/R switches, TX810 can be shut down and turned on quickly as shown in the typical characteristics plots. Considering the low duty cycle of ultrasound imaging, significant power saving can be achieved.

All 6 diodes are high-voltage Schottky diodes to achieve fast recovery time. Following the bridge, a pair of back-to-back diode limits the output voltage of TX810 to about 2Vpp. Different power/performance combination can be selected by users. The TX810 is specified to operate at $\pm 5V$ and VB is biased at 0V. The characteristics of the T/R switch are mainly determined by bias currents. Lower power can be achieved with lower supply voltages. Also, Table 1 shows the relationship among bias current, insertion loss, input noise, power consumption and equivalent resistance.

Table 1. Bias current vs Performance

Test Conditions: $V_P = 5V$, $V_N = -5V$; $V_B = 0V$; $R_{LOAD} = 50\Omega$							
B3	B2	B1	I (mA)	I_L (dB)	IRN (nV/rtHz)	R_{ON} (Ω)	Power (mW/CH)
0	0	0	0	N/A	N/A	High Impedance	0
0	0	1	1	-7	1.12	62	10
0	1	0	2	-5.6	1.10	45	20
0	1	1	3	-5	1.09	39	30
1	0	0	4	-4.6	1.05	35	40
1	0	1	5	-4.4	0.99	33	50
1	1	0	6	-4.2	0.95	31	60
1	1	1	7	-4.1	0.91	30	70

APPLICATION INFORMATION

Similar to discrete T/R switch solutions, external components can be used to optimize system performance. Inductor L and resistor R_{LOAD} before the low voltage receiver amplifier (LVRx) can improve overload recovery time and reduce reflection. The L acts as a high pass filter thus overshoot or recovery response spikes can be suppressed to minimal. The L and R_{LOAD} terminate the entire signal path and can reduce reflection; therefore axial resolution in ultrasound image might be improved. However, the combined impedance of L and R_{LOAD} may affect the system sensitivity. The insertion loss of T/R switch is determined by the input impedance of receiver amplifier and R_{ON} of the TX810. L also creates a DC path for any offset caused by mismatching. The inductor can be as low as 10s μ H to suppress low frequency signals from transmitter, transducer, multiplexer, and TX810. The optimization of L and R_{LOAD} is always an important topic for system designers. AC coupling are typically used between transmitter and T/R switch or T/R switch and amplifier. Thus amplifiers with DC biased inputs will not interference with T/R switch.

One challenge for integrating multiple channel circuits on a small package is how to reduce cross talk. In ultrasound systems, acoustic cross talk from adjacent transducer elements is a dominant source. The cross talk from transducer elements is in a range of -30 to -35dBc for array transducers. Circuit cross talk is usually at least 20dB better than the transducer cross talk. The special considerations were implemented in both TX810 design and layout. The cross talk among TX810 channels is reduced to below -60 dBc as show in the specification table.

In ultrasound Doppler applications, modulation effect in system can influence image quality and sensitivity. Ultrasound system is a complex mixed-signal system with all kinds of digital and analog circuits. Digital signals and clock signals can contaminate analog signals on system level or on chip level. Nonlinear components, such as transistors and diodes, can modulate noise and contaminate signals. In Doppler applications, the Doppler signal frequency could range from 20Hz to >50KHz. Meanwhile, multiple system clocks are also in this range, such as frame clock, image line clock, and etc. These noise signals could enter chip through ground and power supply pins. It is important to study the power supply modulation ratio (PSMR) at chip level. Noise signal with certain frequency and amplitude can be applied on supply pins. Side band signals could be found if modulation effect exists. The PSMR is expressed as an amplitude ratio between carrier and side band signals. Beside PSMR, 3rd order intermodulation ratio (IMD3) is a standard specification for mixed-signal ICs. Users can use IMD3 to estimate the potential artifact Doppler mirror signals. Both specs can be found in the specification table.

The schematic of the basic connection for TX810 is shown in [Figure 15](#). Optional inductors and resistors can be used at TX810 outputs depending on transducer characteristics as discussed above. Standard decoupling capacitors 0.1 μ F should be placed close to power supply pins. The pin out of TX810 is optimized for PCB layout. All signals are going from left to right straightly.

REVISION HISTORY

Changes from Original (September 2009) to Revision A

Page

- Changed From: Product Preview To: Production. The Product Preview was a two page data sheet containing the front page and the pin out section 1

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
TX810IRHHR	ACTIVE	VQFN	RHH	36	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
TX810IRHHT	ACTIVE	VQFN	RHH	36	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK NO-LEAD

4205094/C 06/09

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. QFN (Quad Flatpack No-Lead) Package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

4208014/A 06/06

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
