Rev. 1.7

FEATURES

- 2.5 W/CH Into 4Ω from 5V power supply at THD = 10% (Typ.).
- 2.5V~5.5V Power supply.
- Low shutdown Current.
- Low Quiescent Current.
- Minimum external components.
- No output filter required for inductive loads.
- Output Pin Short-Circuit Protection (Short to Output Pin, Short to GND, Short to VCC)
- Low noise during turn-on and turn-off transitions.
- Lead free and green package available. (RoHS Compliant)
- Wafer Chip Scale (WCSP) and TSSOP 20 pin packaging available.

GENERAL DESCRIPTION

The LY8210 is a high efficiency, 2.5 W stereo class D audio power amplifier. It is a low noise, filterless PWM architecture eliminates the output filter. reducing external component count, system cost, and simplify design.

LY8210

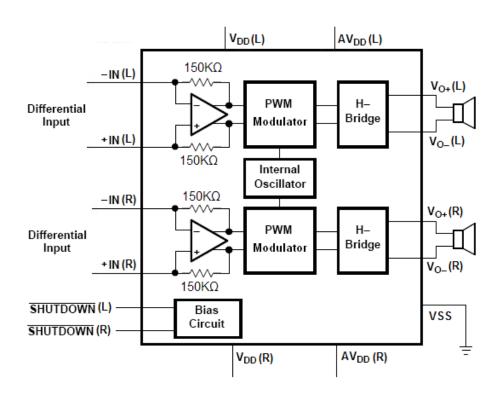

The LY8210 is designed to meet of Multimedia application includes mobile phones and other portable electronic devices. The LY8210 is a single 5V supply, it is capable of driving 4Ω speaker load at a continuous average output of 2.5 W/CH with 10% THD+N.

In cellular handsets, the earpiece, speaker phone, and melody ringer can each be driven by the LY8210. Output pin short circuit (short to output pin, short to ground and short to VDD) protection prevent the device from damage during fault conditions.

APPLICATION

- Portable electronic devices
- Mobile Phones, PDAs
- DVD/CD Players, TFT LCD TVs/Monitors
- USB Audio, 2.1 / 5.1 CH Audio System

APPLICATION INFORMATION

Fully Differential Amplifier

The LY8210 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage on the output that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around VDD/2 regardless of the common-mode voltage at the input. The fully differential LY8210 can still be used with a single-ended input; however, the LY8210 should be used with differential inputs when in a noisy environment, like a wireless handset, to ensure maximum noise rejection.

Input Resistors (Ri) and Gain

The LY8210 has two internal amplifier stages. The pre-amplifier gain is externally configurable, while the total gain is internally fixed. The closed-loop gain of the pre-amplifier gain is set by selecting the Rf to Ri while the total gain is fixed at 2x. So the input resistors (Ri) set the gain of the amplifier according to the equation.

Pre-Amplifier Gain = Rf / Ri

Total Gain = $(Rf/Ri) \times 2$

 $AvD = 20 \times \log [2 \times (Rf/Ri)]$

The resistor matching is very important in the amplifiers. Balance of the output on the reference voltage depends on matched ratio of the resistors. CMRR, PSRR, and cancellation of the second harmonic distortion if resistor mismatch occurs. Therefore, it is recommended to use 1% tolerance resistors or better to keep the performance optimized. Matching is more important than overall tolerance.

Resistor arrays with 1% matching can be used with a tolerance greater than 1%. Place the input resistors very close to the LY8210 to limit noise injection on the high-impedance nodes. For optimal performance the gain should be set to 2 V/V or lower. Lower gain allows the LY8210 to operate at its best,

For example

Table 1. Typical Total Gain and AvD Values

Rf (KΩ)	150	150	150	150	150	150
Ri (KΩ)	150	75	50	37.5	25	18.75
Pre AMP. Gain	1	2	3	4	6	8
Total Gain	2	4	6	8	12	16
Avd (db)	6.02	12.04	15.56	18.06	21.58	24.08

Input Capacitors (Ci)

The LY8210 using fully differential source, So the input coupling capacitors are required. The input capacitors and input resistors form a high-pass filter with the corner frequency(fc), determined in the equation.

 $fc = 1 / (2\pi Ri Ci)$

The value of the input capacitor is important to consider as it directly affects the bass (low frequency) performance of the circuit. Speakers in wireless phones cannot usually respond well to low frequencies, so the corner frequency can be set to block low frequencies in this application. Equation is reconfigured to solve for the input coupling capacitance.

 $Ci = 1 / (2\pi Ri fc)$

If the corner frequency is within the audio band, the capacitors should have a tolerance of $\pm 10\%$ or better, because any mismatch in capacitance causes an impedance mismatch at the corner frequency and below.

Rev. 1.7

For example

In the table 2 shows the external components. Rin in connect with Cin to create a high-pass filter.

Table 2. Typical Component Values

	7:	
Reference	Description	Note
Ri	150ΚΩ	1% tolerance resistors
Ci	0.22uF	80%/–20%

 $Ci = 1 / (2\pi Ri fc)$

Ci = 1 / ($2\pi \times 150$ K $\Omega \times 4.8$ Hz)=0.221uF, Use 0.22uF

Decoupling Capacitor (Cs)

The LY8210 is a high-performance class-D audio amplifier that requires adequate power supply decoupling to ensure the efficiency is high and total harmonic distortion (THD) is low. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 1.0uF, placed as close as possible to the device VDD lead works best. Placing this decoupling capacitor close to the LY8210 is very important for the efficiency of the class-D amplifier, because any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency. For filtering lower-frequency noise signals, a 10.0uF or greater capacitor placed near the audio power amplifier would also help, but it is not required in most applications because of the high PSRR of this device.

PCB Layout

All the external components must place very close to the LY8210. The input resistors need to be very close to the LY8210 input pins so noise does not couple on the high impedance nodes between the input resistors and the input amplifier of the LY8210. Then place the decoupling capacitor Cs, close to the LY8210 is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

Making the high current traces going to VDD, GND, Vo+ and Vo- pins of the LY8210 should be as wide as possible to minimize trace resistance. If these traces are too thin, the LY8210's performance and output power will decrease. The input traces do not need to be wide, but do need to run side-by-side to enable common-mode noise cancellation.
