

Small, Low Power, Current-Output Ambient Light Photo Detect IC

The ISL29006, ISL29007, and ISL29008 are light-to-current silicon optical sensors combining a photodiode array and a current amplifier on a single monolithic IC. The photodiode's spectral sensitivity approximates the human eye response peaking at 550nm with virtually no infrared (IR) response.

Exposed to light, these light sensors give current outputs that are linearly proportional to the light intensity. The output of ISL29006 is configured as a current source, and the output of ISL29007 is configured as a current sink. Both ISL29006 and ISL29007 offer an EN pin that can be used for a polling scheme to extend the battery life of portable devices.

The ISL29008 has dual outputs simultaneously sinking and sourcing current. With output currents at opposite polarity, it can simultaneously control two light sources/drivers that have incongruent illumination requirement depending on ambient light conditions. For example, at bright ambient light levels, display backpanels need more intensity while the keyboard illumination needs to be dimmer, whereas at darker ambient light levels, display backpanels need less intensity while the keyboard illumination needs to be brighter.

By connecting an external resistor from ISRC to GND or from ISNK to VDD, the current output can be converted into voltage output.

Housed in an ultra-compact 2mmx2.1mm ODFN clear plastic package, this device is excellent for power saving control function in cell phones, PDAs and other handheld applications.

Features

- 0.5 lux to 10,000 lux range
- 1.8V to 3.6V supply range
- Low supply current (3.5µA @ 100 lux)
- Fast response time
- Close to human eye response
- IR Rejection
- Internal dark current compensation
- Lux to current source or/and sink
- Excellent output linearity of luminance
- 6 Ld ODFN: 2mmx2.1mmx0.7mm
- Pb-free (RoHS compliant)

Applications

- Display and keypad dimming for:
 - Mobile devices: smart phone, PDA, GPS
 - Computing devices: notebook PC, webpod
 - Consumer devices: LCD-TV, digital picture frame, digital camera
- Industrial and medical light sensing

Application Information

Light-to-Current and Voltage Conversion

The ISL29006, ISL29007 and ISL29008 have responsiveness that is directly proportional to the intensity of light intercepted by the photodiode arrays. Conversion rate is independent of the light sources (fluorescent light, incandescent light or direct sunlight).

$$I_{OUT} = \left(\frac{1.6\mu A}{100\text{lux}} \right) \times E \quad (\text{EQ. 1})$$

Here, I_{OUT} is the output current in μA , and E is the input light in lux.

For some applications, a load resistor is added between the output and the ground, as shown in Figure 1. The output voltage can be expressed in Equation 2:

$$V_{OUT} = I_{OUT} \times R_L = \left(\frac{1.6\mu A}{100\text{lux}} \right) \times E \times R_L \quad (\text{EQ. 2})$$

Here, V_{OUT} is the output voltage and R_L is the value of the external load resistor. The compliance of the ISL29006's output circuit may result in premature saturation of the output current and voltage when an excessively large R_L is used. The output compliance voltage is 300mV below the supply voltage as listed in V_{O-MAX} of the "Electrical Specifications" table on page 3.

In order to have the linear relationship between the input light and the output current and voltage, a proper resistor value (i.e., gain) should be picked for a specific input light range. The resistor value can be picked according to Equation 3:

$$R_L = \frac{(V_{SUP} - 0.3V)}{1.6\mu A} \times \frac{100\text{lux}}{E_{RANGE}} \quad (\text{EQ. 3})$$

Here, V_{SUP} is the supply voltage and E_{RANGE} is the specific input light range for an application. For example, an indoor light ranges typically from 0 lux to 1,000 lux. A resistor value of 270k Ω for 3V supply voltage can be used. For a small light range, a large resistor value should be used to achieve better sensitivity; for a large light range, a small resistor value should be used to prevent non-linear output current and voltage.

Application Examples

The following examples present from fully automatic to fully manual override implementations. These guidelines are applicable to a wide variety of potential light control applications. The ISL29006, ISL29007 and ISL29008 can be used to control the brightness input of CCFL inverters. Likewise, it can interface well with LED drivers. In each specific application, it is important to recognize the target environment and its ambient light conditions. The mechanical mounting of the sensor, light aperture hole size and use of a light pipe or bezel are critical in determining the

response of the ambient light detector for a given exposure of light.

The example in Figure 20 shows a fully automatic dimming solution with no user interaction. Choose R_1 and R_2 values for any desired minimum brightness and slope. Choose C_1 to adjust response time and to filter 50/60Hz room lighting. For example, suppose you wish to generate an output voltage from 0.25V to 1.2V to drive the input of an LED driver controller. The 0.25V represents the minimum LED brightness and 1.2V represents the maximum. The 1st step would be to determine the ratio of R_1 and R_2 in Equation 4:

$$R_1 = R_2 \times \left(\frac{3.0V}{0.25V} - 1 \right) = 11 \times R_2 \quad (\text{EQ. 4})$$

FIGURE 20.

Next, the value of R_2 can be calculated based on the maximum output current coming from the ISL29006 under the application's maximum light exposure. Suppose the current has been determined to be about 2 μA . Thus, R_2 can be approximately calculated using Equations 5 and 6:

$$R_2 = \left(\frac{1.2V}{2\mu A} \right) = 60k\Omega \quad (\text{EQ. 5})$$

and Equation 6:

$$R_1 = 11 \times R_2 = 660k\Omega \quad (\text{EQ. 6})$$

In Figure 20, the 3VDC supply can be replaced with a user adjustable bias control, such as 3V PWM control to allow control over the minimum and maximum output voltage.

Figure 21 shows that ISL29006 is used to provide automatic dimming control.

Short Circuit Current Limit

The ISL29006, ISL29007 and ISL29008 do not limit the output short circuit current. If the output is directly shorted to the ground continuously, the output current could easily increase for a strong input light such that the device may be damaged. Maximum reliability is maintained if the output continuous current never exceeds 6mA by adding a load

resistor at the output. This limit is set by the design of the internal metal interconnects.

ISL29008 has the capability of both sourcing and sinking current simultaneously. It may replace ISL29006 in sourcing current applications, or ISL29007 in sinking current applications. In applications that require both sourcing and sinking currents, for example in cases of mobile phones or PDAs where the display brightness needs to be proportional to ambient brightness while the key pads need to be inversely proportional to the brightness, ISL29008 offers the most economical solution for cost and footprint.

Suggested PCB Footprint

Footprint pads should be a nominal 1-to-1 correspondence with package pads. Since ambient light sensor devices do not dissipate high power, heat dissipation through the exposed pad is not important; instead, similar to DFN or QFN, the exposed pad provides robustness in the board mounting process. Therefore, we recommend that the exposed pad be soldered down for robust joint formation, but this is not mandatory.

Power Supply Bypassing and Printed Circuit Board Layout

The ISL29006, ISL29007 and ISL29008 are relatively insensitive to the printed circuit board layout due to their low speed operation. Nevertheless, good printed circuit board layout is necessary for optimum performance. Ground plane construction is highly recommended; lead length should be as short as possible and the power supply pins must be well bypassed to reduce the risk of oscillation. For normal single supply operation where the GND pin is connected to ground, a 0.1μF ceramic capacitor should be placed from the VCC pin to the GND pin. A 4.7μF tantalum capacitor should then be connected in parallel, placed close to the device.

Optical Sensor Location Outline

The green area in Figure 22 shows the optical sensor location outline of ISL29006, ISL29007 and ISL29008. Along the pin-out direction, the center line (CL) of the sensor coincides with that of the packaging. The sensor width in this direction is 0.39mm. Perpendicular to the pin-out direction, the CL of the sensor has a 0.19mm offset from the CL of packaging away from pin-1. The sensor width in this direction is 0.46mm.

FIGURE 21. AUTOMATIC DIMMING CONTROL

$$I_{LED} = \frac{V_{FB}}{R_{LED}} - E \cdot \left(\frac{1.6\mu A}{100lux} \right) \cdot \left(\frac{R_s}{R_{LED}} + 1 \right) \quad (EQ. 7)$$
