# ICS84330CI

## 720MHz, Low JITTER, CRYSTAL-TO-3.3V DIFFERENTIAL LVPECL FREQUENCY SYNTHESIZER

### GENERAL DESCRIPTION

The ICS84330CI is a general purpose, single output high frequency synthesizer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The VCO operates at a frequency range of 250MHz to 720MHz. The VCO and output frequency can be programmed using the serial or parallel interfaces to the configuration logic. The output can be configured to divide the VCO frequency by 1, 2, 4, and 8. Output frequency steps from 250KHz to 2MHz can be achieved using a 16MHz crystal depending on the output divider setting.

### FEATURES

- Fully integrated PLL, no external loop filter requirements
- 1 differential 3.3V LVPECL output
- Crystal oscillator interface: 10MHz to 25MHz
- Output frequency range: 31.25MHz to 720MHz
- VCO range: 250MHz to 720MHz
- Parallel or serial interface for programming M and N dividers during power-up
- RMS Period jitter: 6ps (maximum)
- Cycle-to-cycle jitter: 40ps (maximum)
- 3.3V supply voltage
- -40°C to 85°C ambient operating temperature
- Pin compatible with the MC12430

### PIN ASSIGNMENT

### FUNCTIONAL DESCRIPTION

**NOTE:** The functional description that follows describes operation using a 16MHz crystal. Valid PLL loop divider values for different crystal or input frequencies are defined in the Input Frequency Characteristics, Table 6, NOTE 1.

The ICS84330CI features a fully integrated PLL and therefore requires no external components for setting the loop bandwidth. A quartz crystal is used as the input to the on-chip oscillator. The output of the oscillator is divided by 16 prior to the phase detector. With a 16MHz crystal this provides a 1MHz reference frequency. The VCO of the PLL operates over a range of 250MHz to 720MHz. The output of the M divider is also applied to the phase detector.

The phase detector and the M divider force the VCO output frequency to be 2M times the reference frequency by adjusting the VCO control voltage. Note that for some values of M (either too high or too low), the PLL will not achieve lock. The output of the VCO is scaled by a divider prior to being sent to each of the LVPECL output buffers. The divider provides a 50% output duty cycle.

The programmable features of the ICS84330CI support two input modes to program the M divider and N output divider. The two input operational modes are parallel and serial. Figure 1 shows the timing diagram for each mode. In parallel mode the nP\_LOAD input is LOW. The data on inputs M0 through M8 and

N0 through N1 is passed directly to the M divider and N output divider. On the LOW-to-HIGH transition of the nP\_LOAD input, the data is latched and the M divider remains loaded until the next LOW transition on nP\_LOAD or until a serial event occurs. The TEST output is Mode 000 (shift register out) when operating in the parallel input mode. The relationship between the VCO frequency, the crystal frequency and the M divider is defined as follows:

$$f_{VCO} = \frac{f_{xtal}}{16} \times 2M$$

The M value and the required values of M0 through M8 are shown in Table 3B, Programmable VCO Frequency Function Table. Valid M values for which the PLL will achieve lock are defined as  $125 \leq M \leq 360$ . The frequency out is defined as follows:

$$f_{out} = \frac{f_{VCO}}{N} = \frac{f_{xtal}}{16} \times \frac{2M}{N}$$

Serial operation occurs when nP\_LOAD is HIGH and S\_LOAD is LOW. The shift register is loaded by sampling the S\_DATA bits with the rising edge of S\_CLOCK. The contents of the shift register are loaded into the M divider when S\_LOAD transitions from LOW-to-HIGH. The M divide and N output divide values are latched on the HIGH-to-LOW transition of S\_LOAD. If S\_LOAD is held HIGH, data at the S\_DATA input is passed directly to the M divider on each rising edge of S\_CLOCK. The serial mode can be used to program the M and N bits and test bits T2:T0. The internal registers T2:T0 determine the state of the TEST output as follows in the table below:

| T2 | T1 | T0 | TEST Output                                      | fOUT                |
|----|----|----|--------------------------------------------------|---------------------|
| 0  | 0  | 0  | Shift Register Out                               | fOUT                |
| 0  | 0  | 1  | High                                             | fOUT                |
| 0  | 1  | 0  | PLL Reference Xtal ÷ 16                          | fOUT                |
| 0  | 1  | 1  | (VCO ÷ M) / 2 (non 50% Duty Cycle M divider)     | fOUT                |
| 1  | 0  | 0  | fOUT<br>LVCMOS Output Frequency < 200MHz         | fOUT                |
| 1  | 0  | 1  | Low                                              | fOUT                |
| 1  | 1  | 0  | (S_CLOCK ÷ M) / 2 (non 50% Duty Cycle M divider) | S_CLOCK ÷ N divider |
| 1  | 1  | 1  | fOUT ÷ 4                                         | fOUT                |

**TABLE 1. PIN DESCRIPTIONS**

| Name                                   | Type   |          | Description                                                                                                                                                                           |
|----------------------------------------|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V <sub>CCA</sub>                       | Power  |          | Analog supply pin.                                                                                                                                                                    |
| XTAL1, XTAL2                           |        |          | Crystal oscillator interface. XTAL1 is an oscillator input. XTAL2 is an oscillator output.                                                                                            |
| XTAL_SEL                               | Input  | Pullup   | Selects between the crystal oscillator or FREF_EXT inputs as the PLL reference source. Selects XTAL inputs when HIGH. Selects FREF_EXT when LOW. LVCMOS / LVTTTL interface levels.    |
| OE                                     | Input  | Pullup   | Output enable. LVCMOS / LVTTTL interface levels.                                                                                                                                      |
| nP_LOAD                                | Input  | Pullup   | Parallel load input. Determines when data present at M8:M0 is loaded into M divider, and when data present at N1:N0 sets the N output divide value. LVCMOS / LVTTTL interface levels. |
| M0, M1, M2<br>M3, M4, M5<br>M6, M7, M8 | Input  | Pullup   | M divider inputs. Data latched on LOW-to-HIGH transition of nP_LOAD input. LVCMOS / LVTTTL interface levels.                                                                          |
| N0, N1                                 | Input  | Pullup   | Determines N output divider value as defined in Table 3C Function Table. LVCMOS / LVTTTL interface levels.                                                                            |
| V <sub>EE</sub>                        | Power  |          | Negative supply pins.                                                                                                                                                                 |
| TEST                                   | Output |          | Test output which is used in the serial mode of operation. Single-ended LVPECL interface levels.                                                                                      |
| V <sub>CC</sub>                        | Power  |          | Core supply pins.                                                                                                                                                                     |
| nFOUT, FOUT                            | Output |          | Differential output for the synthesizer. 3.3V LVPECL interface levels.                                                                                                                |
| nc                                     | Unused |          | Do not connect.                                                                                                                                                                       |
| FREF_EXT                               | Input  | Pulldown | PLL reference input. LVCMOS / LVTTTL interface levels.                                                                                                                                |
| S_CLOCK                                | Input  | Pulldown | Clocks the serial data present at S_DATA input into the shift register on the rising edge of S_CLOCK. LVCMOS / LVTTTL interface levels.                                               |
| S_DATA                                 | Input  | Pulldown | Shift register serial input. Data sampled on the rising edge of S_CLOCK. LVCMOS / LVTTTL interface levels.                                                                            |
| S_LOAD                                 | Input  | Pulldown | Controls transition of data from shift register into the M divider. LVCMOS / LVTTTL interface levels.                                                                                 |

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

### ABSOLUTE MAXIMUM RATINGS

|                                          |                          |
|------------------------------------------|--------------------------|
| Supply Voltage, $V_{CC}$                 | 4.6V                     |
| Inputs, $V_I$                            | -0.5V to $V_{CC} + 0.5V$ |
| Outputs, $I_O$                           |                          |
| Continuous Current                       | 50mA                     |
| Surge Current                            | 100mA                    |
| Package Thermal Impedance, $\theta_{JA}$ | 37.8°C/W (0 lfpm)        |
| Storage Temperature, $T_{STG}$           | -65°C to 150°C           |

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

**TABLE 4A. POWER SUPPLY DC CHARACTERISTICS,  $V_{CC} = V_{CCA} = 3.3V \pm 5\%$ ,  $T_A = -40^\circ\text{C}$  TO  $85^\circ\text{C}$**

| Symbol    | Parameter             | Test Conditions | Minimum | Typical | Maximum | Units |
|-----------|-----------------------|-----------------|---------|---------|---------|-------|
| $V_{CC}$  | Core Supply Voltage   |                 | 3.135   | 3.3     | 3.465   | V     |
| $V_{CCA}$ | Analog Supply Voltage |                 | 3.135   | 3.3     | 3.465   | V     |

|          |                 | S_CLOCK          |         |         | 50      | MHz   |
|          |                 | FREF_EXT; NOTE 2 | 10      |         |         | MHz   |

NOTE 1: For the crystal frequency range the M value must be set to achieve the minimum or maximum VCO frequency range of 250MHz to 720MHz. Using the minimum frequency of 10MHz, valid values of M are  $200 \leq M \leq 511$ .

Using the maximum frequency of 25MHz, valid values of M are  $80 \leq M \leq 230$ .

NOTE 2: Maximum frequency on FREF\_EXT is dependent on the internal M counter limitations. See Application Information Section for recommendations on optimizing the performance using the FREF\_EXT input.

## APPLICATION INFORMATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS84330CI provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$  and  $V_{CCA}$  should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 2* illustrates how a  $10\Omega$  resistor along with a  $10\mu F$  and a  $.01\mu F$  bypass capacitor should be connected to each  $V_{CCA}$  pin.

FIGURE 2. POWER SUPPLY FILTERING

### TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to

drive  $50\Omega$  transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 3A and 3B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 3A. LVPECL OUTPUT TERMINATION

FIGURE 3B. LVPECL OUTPUT TERMINATION

### LVC MOS TO XTAL INTERFACE

The XTAL1 input can accept single ended LVC MOS signal through an AC couple capacitor. A general interface diagram is shown in *Figure 4*. The XTAL2 input can be left floating. The edge rate can be as slow as 10ns. If the incoming signal has sharp edge rate and the signal path is a long trace, proper termination for the driver and controlled characteristic imped-

ance trace may be required. The input can function with half swing amplitude. Reducing amplitude from full swing of 3.3V to half swing of about 1.65V can prevent signal interfere with power rail and may reduce noise. Please refer to the LVC MOS driver data sheet and application note for amplitude reduction and termination approach.

Figure 4. GENERAL DIAGRAM FOR LVC MOS DRIVER TO XTAL INPUT INTERFACE

FIGURE 5. CYCLE-TO-CYCLE JITTER VS.  $f_{OUT}$  (using a 16MHz XTAL)

The following component footprints are used in this layout example:

All the resistors and capacitors are size 0603.

### POWER AND GROUNDING

Place the decoupling capacitors C3 and C4, as close as possible to the power pins. If space allows, placement of the decoupling capacitor on the component side is preferred. This can reduce unwanted inductance between the decoupling capacitor and the power pin caused by the via.

Maximize the power and ground pad sizes and number of vias capacitors. This can reduce the inductance between the power and ground planes and the component power and ground pins.

The RC filter consisting of R7, C11, and C16 should be placed as close to the  $V_{CCA}$  pin as possible.

### CLOCK TRACES AND TERMINATION

Poor signal integrity can degrade the system performance or cause system failure. In synchronous high-speed digital systems, the clock signal is less tolerant to poor signal integrity than other signals. Any ringing on the rising or falling edge or excessive ring back can cause system failure. The shape of the trace and the trace delay might be restricted by the available space on the board and the component location. While routing the traces, the clock signal traces should be routed first and should be locked prior to routing other signal traces.

- The differential 50 $\Omega$  output traces should have the same length.
- Avoid sharp angles on the clock trace. Sharp angle turns cause the characteristic impedance to change on the transmission lines.
- Keep the clock traces on the same layer. Whenever possible, avoid placing vias on the clock traces. Placement of vias on the traces can affect the trace characteristic impedance and hence degrade signal integrity.
- To prevent cross talk, avoid routing other signal traces in parallel with the clock traces. If running parallel traces is unavoidable, allow a separation of at least three trace widths between the differential clock trace and the other signal trace.
- Make sure no other signal traces are routed between the clock trace pair.
- The matching termination resistors should be located as close to the receiver input pins as possible.

### CRYSTAL

The crystal X1 should be located as close as possible to the pins 4 (XTAL1) and 5 (XTAL2). The trace length between the X1 and U1 should be kept to a minimum to avoid unwanted parasitic inductance and capacitance. Other signal traces should not be routed near the crystal traces.

FIGURE 6B. PCB BOARD LAYOUT FOR ICS84330CI

## JITTER REDUCTION FOR FREF\_EXT SINGLE END INPUT

If the FREF\_EXT input is driven by a 3.3V LVCMOS driver, the jitter performance can be improved by reducing the amplitude swing and slowing down the edge rate. *Figure 7A* shows an amplitude reduction approach for a long trace. The swing will be approximately 0.85V for logic low and 2.5V for logic high

(instead of 0V to 3.3V). *Figure 7B* shows amplitude reduction approach for a short trace. The circuit shown in *Figure 7C* reduces amplitude swing and also slows down the edge rate by increasing the resistor value.

**FIGURE 7A. AMPLITUDE REDUCTION FOR A LONG TRACE**

**FIGURE 7B. AMPLITUDE REDUCTION FOR A SHORT TRACE**

**FIGURE 7C. EDGE RATE REDUCTION BY INCREASING THE RESISTOR VALUE**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS84330CI. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS84330CI is the sum of the core power plus the power dissipated in the load(s).

The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 17mA = 58.9mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $1 * 30mW = 30mW$

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $58.9 + 30mW = 88.9mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 31.1°C/W per Table 9A below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.89W * 31.1^\circ C/W = 112.7^\circ C. \text{ This is well below the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in the *Figure 8*.

**FIGURE 8. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.9V$

$$(V_{CC\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.7V$

$$(V_{CC\_MAX} - V_{OL\_MAX}) = 1.7V$$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30mW$

| Single-Layer PCB, JEDEC Standard Test Boards                                                                        | 67.8°C/W | 55.9°C/W | 50.1°C/W |
| Multi-Layer PCB, JEDEC Standard Test Boards                                                                         | 47.9°C/W | 42.1°C/W | 39.4°C/W |
| <b>NOTE:</b> Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs. |          |          |          |

### TRANSISTOR COUNT

The transistor count for ICS84330CI is: 4498

Integrated  
Circuit  
Systems, Inc.

# ICS84330CI

720MHz, Low JITTER, CRYSTAL-TO-3.3V  
DIFFERENTIAL LVPECL FREQUENCY SYNTHESIZER

## PACKAGE OUTLINE - V SUFFIX FOR 28 LEAD PLCC

TABLE 11A. PACKAGE DIMENSIONS
