Functional Description

The CY7C1062DV33 is a high performance CMOS Static RAM organized as 524,288 words by 32 bits.

To write to the device, take Chip Enables ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW) and Write Enable ($\overline{WE}$) input LOW. If Byte Enable A ($\overline{B}_A$) is LOW, then data from IO pins (IO_0 through IO_7) is written into the location specified on the address pins (A_0 through A_{18}). If Byte Enable B ($\overline{B}_B$) is LOW, then data from IO pins (IO_8 through IO_{15}) is written into the location specified on the address pins (A_0 through A_{18}). Likewise, $\overline{B}_C$ and $\overline{B}_D$ correspond with the IO pins IO_{16} to IO_{23} and IO_{24} to IO_{31} , respectively.

To read from the device, take Chip Enables ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW), and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If the first Byte Enable ($\overline{B}_A$) is LOW, then data from the memory location specified by the address pins appear on IO_0 to IO_7 . If Byte Enable B ($\overline{B}_B$) is LOW, then data from memory appears on IO_8 to IO_{15} . Likewise, $\overline{B}_C$ and $\overline{B}_D$ correspond to the third and fourth bytes. For more information, see [Truth Table](#) on page 9 for a complete description of read and write modes.

The input and output pins (IO_0 through IO_{31}) are placed in a high impedance state when the device is deselected ($\overline{CE}_1$, $\overline{CE}_2$, or $\overline{CE}_3$ HIGH), the outputs are disabled ($\overline{OE}$ HIGH), the byte selects are disabled ($\overline{B}_{A-D}$ HIGH), or during a write operation ($\overline{CE}_1$, $\overline{CE}_2$ and $\overline{CE}_3$ LOW, and $\overline{WE}$ LOW).

Note

- Valid SRAM operation does not occur until the power supplies have reached the minimum operating V_{DD} (3.0V). $100\mu\text{s}$ (t_{power}) after reaching the minimum operating V_{DD} , normal SRAM operation begins including reduction in V_{DD} to the data retention (V_{CCDR} , 2.0V) voltage.

Notes

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, and input pulse levels of 0 to 3.0V. Test conditions for the read cycle use output loading as shown in (a) of [AC Test Loads and Waveforms](#), unless specified otherwise.
- t_{POWER} gives the minimum amount of time that the power supply is at typical V_{CC} values until the first memory access is performed.
- t_{HZOE} , t_{HZCE} , t_{HZWE} , t_{HZBE} , t_{LZOE} , t_{LZCE} , t_{LZWE} , and t_{LZBE} are specified with a load capacitance of 5 pF as in (b) of [AC Test Loads and Waveforms](#). Transition is measured ± 200 mV from steady state voltage.
- These parameters are guaranteed by design and are not tested.
- The internal write time of the memory is defined by the overlap of $\overline{\text{CE}}_1$ LOW, $\overline{\text{CE}}_2$ LOW, $\overline{\text{CE}}_3$ LOW and $\overline{\text{WE}}$ LOW. Chip enables must be active and $\overline{\text{WE}}$ must be LOW to initiate a write, and the transition of any of these signals terminate the write. The input data setup and hold timing are referenced to the leading edge of the signal that terminates the write.
- The minimum write cycle time for Write Cycle No.2 ($\overline{\text{WE}}$ controlled, $\overline{\text{OE}}$ LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

Figure 2. Read Cycle No. 1 ^[13, 14]

Notes

11. Tested initially and after any design or process changes that affects these parameters.
12. Full device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min)} \geq 50 \mu s$ or stable at $V_{CC(min)} \geq 50 \mu s$
13. Device is continuously selected. $\overline{OE}$, $\overline{CE}$, $\overline{B_A}$, $\overline{B_B}$, $\overline{B_C}$, $\overline{B_D} = V_{IL}$.
14. $\overline{WE}$ is HIGH for read cycle.

Figure 4. Write Cycle No. 1 ($\overline{\text{CE}}$ Controlled) [3, 15, 16, 17]

Notes

15. Address valid before or similar to $\overline{\text{CE}}$ transition LOW.
16. Data IO is high impedance if $\overline{\text{OE}}$ or $\overline{\text{B}}_{\text{A}}$, $\overline{\text{B}}_{\text{B}}$, $\overline{\text{B}}_{\text{C}}$, $\overline{\text{B}}_{\text{D}}$ = V_{IH} .
17. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ going HIGH, the output remains in a high impedance state.
