

KK74ACT193

Presettable 4-Bit Binary UP/DOWN Counter High-Speed Silicon-Gate CMOS

The KK74ACT193 is identical in pinout to the LS/ALS192, HC/HCT192. The KK74ACT193 may be used as a level converter for interfacing TTL or NMOS outputs to High Speed CMOS inputs.

The counter has two separate clock inputs, a Count Up Clock and Count Down Clock inputs. The direction of counting is determined by which input is clocked. The outputs change state synchronous with the LOW-to-HIGH transitions on the clock inputs. This counter may be preset by entering the desired data on the P0, P1, P2, P3 input. When the Parallel Load input is taken low the data is loaded independently of either clock input. This feature allows the counters to be used as divide-by-n by modifying the count length with the preset inputs. In addition the counter can also be cleared. This is accomplished by inputting a high on the Master Reset input. All 4 internal stages are set to low independently of either clock input. Both a Terminal Count Down (TC_D) and Terminal Count Up (TC_U) Outputs are provided to enable cascading of both up and down counting functions. The TC_D output produces a negative going pulse when the counter underflows and TC_U outputs a pulse when the counter overflows. The counter can be cascaded by connecting the TC_U and TC_D outputs of one device to the Count Up Clock and Count Down Clock inputs, respectively, of the next device.

- TTL/NMOS Compatible Input Levels
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 4.5 to 5.5 V
- Low Input Current: 1.0 μ A; 0.1 μ A @ 25°C
- Outputs Source/Sink 24 mA

* V_{IN} from 0.8 V to 2.0 V

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range $GND \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{CC}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

Logic equations

For Terminal Count:

$$\overline{TC_U} = Q_0 \cdot Q_1 \cdot Q_2 \cdot Q_3 \cdot \overline{CP_U}$$

$$TC_D = Q_0 \cdot Q_1 \cdot Q_2 \cdot Q_3 \cdot CP_D$$
