Functional Description^[1]

The CY62168EV30 is a high performance CMOS static RAM organized as 2M words by 8 bits. This device features advanced circuit design to provide an ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption by 90% when addresses are not

toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected (Chip Enable 1 ($\overline{CE}_1$) HIGH or Chip Enable 2 (CE_2) LOW). The input and output pins (IO_0 through IO_7) are placed in a high impedance state when: the device is deselected (Chip Enable 1 ($\overline{CE}_1$) HIGH or Chip Enable 2 (CE_2) LOW), outputs are disabled ($\overline{OE}$ HIGH), or a write operation is in progress (Chip Enable 1 ($\overline{CE}_1$) LOW and Chip Enable 2 (CE_2) HIGH and WE LOW).

Write to the device by taking Chip Enable 1 ($\overline{CE}_1$) LOW and Chip Enable 2 (CE_2) HIGH and the Write Enable (WE) input LOW. Data on the eight IO pins (IO_0 through IO_7) is then written into the location specified on the address pins (A_0 through A_{20}).

Read from the device by taking Chip Enable 1 ($\overline{CE}_1$) and Output Enable ($\overline{OE}$) LOW and Chip Enable 2 (CE_2) HIGH while forcing Write Enable (WE) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the IO pins.

The eight input and output pins (IO_0 through IO_7) are placed in a high impedance state when the device is deselected ($\overline{CE}_1$ LOW and CE_2 HIGH), the outputs are disabled ($\overline{OE}$ HIGH), or a write operation is in progress ($\overline{CE}_1$ LOW and CE_2 HIGH and WE LOW). See the "Truth Table" on page 8 for a complete description of read and write modes.

Notes

11. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less (1V/ns), timing reference levels of $V_{CC}(\text{typ})/2$, input pulse levels of 0 to $V_{CC}(\text{typ})$, and output loading of the specified I_{OL}/I_{OH} as shown in "AC Test Loads and Waveforms" on page 4.
12. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
13. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
14. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

Notes

15. The device is continuously selected. $\overline{OE}$, $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$.

16. $\overline{WE}$ is HIGH for read cycle.

17. Address valid before or similar to $\overline{CE}_1$ transition LOW and CE_2 transition HIGH.

Notes

18. Data IO is high impedance if $\overline{OE} = V_{IH}$.

19. If $\overline{CE_1}$ goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

20. During this period the IOs are in output state. Do not apply input signals.
