

Features

- Operating Range: 1.71 V to 5.5 V
- Low power CapSense® block
 - Configurable capacitive sensing elements
 - Supports SmartSense
 - Supports a combination of CapSense buttons, sliders, touchpads, touchscreens, and proximity sensors
- Powerful Harvard-architecture processor
 - M8C CPU speed can be up to 24 MHz or sourced by an external crystal, resonator, or clock signal
 - Low power at high speed
 - Interrupt controller
 - Temperature range: -40 °C to +85 °C
- Flexible on-chip memory
 - Three program/data storage size options:
 - CY8C20x36A: 8 KB flash / 1 KB SRAM
 - CY8C20x46A, CY8C20x96A: 16 KB flash/2 KB SRAM
 - CY8C20x66A: 32 KB flash/2 KB SRAM
 - 50,000 flash erase/write cycles
 - Partial flash updates
 - Flexible protection modes
 - In-system serial programming (ISSP)
- Full-speed USB
 - Available on CY8C20646A, CY8C20666A, CY8C20x96A only
 - 12 Mbps USB 2.0 compliant
 - Eight unidirectional endpoints
 - One bidirectional control endpoint
 - Dedicated 512 byte buffer
 - Internally regulated at 3.3 V
- Precision, programmable clocking
 - Internal main oscillator (IMO): 6/12/24 MHz ± 5%
 - Internal low speed oscillator (ILO) at 32 kHz for watchdog and sleep timers
 - Precision 32 kHz oscillator for optional external crystal
 - 0.25% accuracy for USB with no external components (CY8C20646A, CY8C20666A, CY8C20x96A only)
- Programmable pin configurations
 - Up to 36 general-purpose I/Os (GPIOs) (depending on package)
 - Dual mode GPIO: All GPIOs support digital I/O and analog inputs
 - 25-mA sink current on each GPIO
 - 120 mA total sink current on all GPIOs
 - Pull-up, high Z, open-drain modes on all GPIOs
 - CMOS drive mode – 5 mA source current on ports 0 and 1 and 1 mA on ports 2, 3, and 4
 - 20 mA total source current on all GPIOs
 - Selectable, regulated digital I/O on port 1
 - Configurable input threshold on port 1
 - Hot-swap capability on all Port 1 GPIO
- Versatile analog mux
 - Common internal analog bus
 - Simultaneous connection of I/O
 - High power supply rejection ratio (PSRR) comparator
 - Low-dropout voltage regulator for all analog resources
- Additional system resources
 - I²C Slave:
 - Selectable to 50 kHz, 100 kHz, or 400 kHz
 - No clock stretching (under most conditions)
 - Implementation during sleep modes with less than 100 µA
 - Hardware address validation
 - SPI master and slave: Configurable 46.9 kHz to 12 MHz
 - Three 16-bit timers
 - Watchdog and sleep timers
 - Internal voltage reference
 - Integrated supervisory circuit
 - 8 to 10-bit incremental analog-to-digital converter (ADC)
 - Not available on CY8x20xx6AN versions
 - Two general-purpose high speed, low power analog comparators
- Complete development tools
 - Free development tool (PSoC Designer™)
 - Full-featured, in-circuit emulator (ICE) and programmer
 - Full-speed emulation
 - Complex breakpoint structure
 - 128 KB trace memory
- Package options
 - CY8C20x36A:
 - 16-Pin 3 × 3 × 0.6 mm QFN
 - 24-Pin 4 × 4 × 0.6 mm QFN
 - 32-Pin 5 × 5 × 0.6 mm QFN
 - 48-Pin SSOP
 - 48-Pin 7 × 7 × 1.0 mm QFN
 - CY8C20x46A:
 - 16-Pin 3 × 3 × 0.6 mm QFN
 - 24-Pin 4 × 4 × 0.6 mm QFN
 - 30-Ball WLCSP
 - 32-Pin 5 × 5 × 0.6 mm QFN

PSoC® Functional Overview

The PSoC family consists of on-chip controller devices, which are designed to replace multiple traditional microcontroller unit (MCU)-based components with one, low cost single-chip programmable component. A PSoC device includes configurable analog and digital blocks, and programmable interconnect. This architecture allows the user to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The architecture for this device family, as shown in the [Logic Block Diagram on page 2](#), consists of three main areas:

- The Core
- CapSense Analog System
- System Resources (including a full-speed USB port).

A common, versatile bus allows connection between I/O and the analog system.

Each CY8C20x36A/46A/66A/96A PSoC device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. Depending on the PSoC package, up to 36 GPIO are also included. The GPIO provides access to the MCU and analog mux.

PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO and ILO. The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a 4-MIPS, 8-bit Harvard-architecture microprocessor.

CapSense System

The analog system contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. The analog system is composed of the CapSense PSoC block and an internal 1 V or 1.2 V analog reference, which together support capacitive sensing of up to 33 inputs^[2]. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins are completed quickly and easily across multiple ports.

SmartSense™

SmartSense is an innovative solution from Cypress that removes manual tuning of CapSense applications. This solution is easy to use and provides a robust noise immunity. It is the only auto-tuning solution that establishes, monitors, and maintains all required tuning parameters. SmartSense allows engineers to go from prototyping to mass production without re-tuning for manufacturing variations in PCB and/or overlay material properties.

Figure 1. CapSense System Block Diagram

Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Complex capacitive sensing interfaces, such as sliders and touchpads.
- Chip-wide mux that allows analog input from any I/O pin.
- Crosspoint connection between any I/O pin combinations.

Note

2. 36 GPIOs = 33 pins for capacitive sensing + 2 pins for I²C + 1 pin for modulator capacitor.

Additional System Resources

System resources provide additional capability, such as configurable USB and I²C slave, SPI master/slave communication interface, three 16-bit programmable timers, and various system resets supported by the M8C.

These system resources provide additional capability useful to complete systems. Additional resources include low voltage detection and power on reset. The merits of each system resource are listed here:

- The I²C slave/SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over three or four wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- The I²C hardware address recognition feature reduces the already low power consumption by eliminating the need for CPU intervention until a packet addressed to the target device is received.
- The I²C enhanced slave interface appears as a 32-byte RAM buffer to the external I²C master. Using a simple predefined protocol, the master controls the read and write pointers into the RAM. When this method is enabled, the slave does not stall the bus when receiving data bytes in active mode. For usage details, refer to the application note [I2C Enhanced Slave Operation - AN56007](#).
- Low-voltage detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced power-on-reset (POR) circuit eliminates the need for a system supervisor.
- An internal reference provides an absolute reference for capacitive sensing.
- A register-controlled bypass mode allows the user to disable the LDO regulator.

Getting Started

The quickest way to understand PSoC silicon is to read this datasheet and then use the PSoC Designer Integrated Development Environment (IDE). This datasheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications.

For in depth information, along with detailed programming details, see the [Technical Reference Manual](#) for the CY8C20x36A/46A/66A/96A PSoC devices.

For up-to-date ordering, packaging, and electrical specification information, see the latest PSoC device datasheets on the web at www.cypress.com/psoc.

Application Notes

Application notes are an excellent introduction to the wide variety of possible PSoC designs. They are located at www.cypress.com/psoc. Select Application Notes under the Documentation tab.

Development Kits

PSoC Development Kits are available online from Cypress at www.cypress.com/shop and through a growing number of regional and global distributors, which include Arrow, Avnet, Digi-Key, Farnell, Future Electronics, and Newark. Refer to [Development Kits on page 35](#).

Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs.

These configurable resources, called PSoC blocks, have the ability to implement a wide variety of user-selectable functions. The PSoC development process is summarized in the following four steps:

1. Select components
2. Configure components
3. Organize and connect
4. Generate, verify, and debug

Select Components

PSoC Designer provides a library of prebuilt, pretested hardware peripheral components. These components are called user modules. User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and programmable system-on-chip varieties.

Configure Components

Each of the components you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a Timer User Module configures one digital PSoC block. The user module parameters permit you to establish the period, mode, and timer clock. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus.

User modules are documented in datasheets that are viewed directly in PSoC Designer. These datasheets explain the internal operation of the component and provide performance specifications. Each datasheet describes the use of each user module parameter and other information you may need to successfully implement your design.

Organize and Connect

You build signal chains by interconnecting user modules to each other and the I/O pins. You perform the selection, configuration, and routing so that you have complete control over the use of all on-chip resources.

Generate, Verify, and Debug

When you are ready to test the hardware configuration or move to developing code for the project, you perform the 'Generate Configuration Files' step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system. Based on your design, software is generated. Application programming interfaces (APIs) are provided with high level functions to control and respond to hardware events at run time and interrupt service routines that you can adapt as needed.

A complete code development environment allows you to develop and customize your applications in C, assembly language, or both. The last step in the development process takes place inside PSoC Designer's Debugger (access by clicking the Connect icon). PSoC Designer downloads the HEX image to the ICE where it runs at full speed. PSoC Designer debugging capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the debug interface provides a large trace buffer and allows you to define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

Pinouts

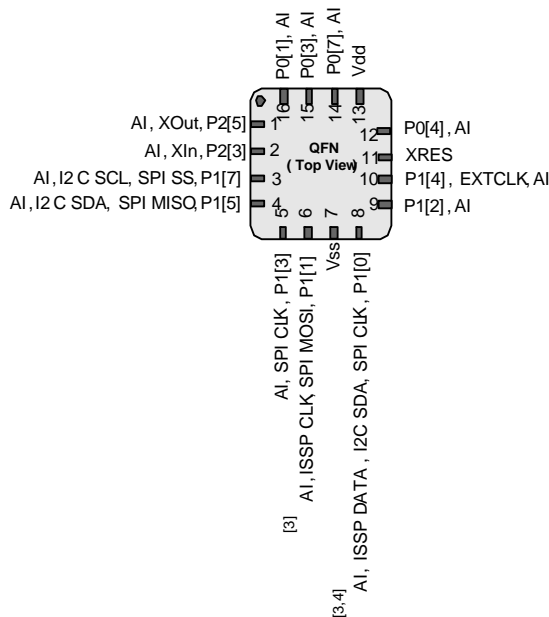

The CY8C20x36A/46A/66A/96A PSoC device is available in a variety of packages, which are listed and illustrated in the following tables. Every port pin (labeled with a “P”) is capable of Digital I/O and connection to the common analog bus. However, V_{SS} , V_{DD} , and XRES are not capable of Digital I/O.

Notes

- On power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to high impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.
- Alternate SPI clock.

Notes

- The center pad (CP) on the QFN package must be connected to ground (V_{SS}) for best mechanical, thermal, and electrical performance. If not connected to ground, it must be electrically floated and not connected to any other signal.
- On power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1])line drives resistive low for 512 sleep clock cycles and both the pins transition to high impedance state. Notes

19. On power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to high impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.

Notes

24. On Power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1])line drives resistive low for 512 sleep clock cycles and both the pins transition to High impedance state. On reset, after XRES de- asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. In both cases, a pull-up resistance on these lines combines with the pull-down resistance (5.6K ohm) and form a potential divider. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.
25. The center pad (CP) on the QFN package must be connected to ground (V_{SS}) for best mechanical, thermal, and electrical performance. If not connected to ground, it must be electrically floated and not connected to any other signal.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8C20x36A/46A/66A/96A PSoC devices. For the latest electrical specifications, confirm that you have the most recent datasheet by visiting the web at <http://www.cypress.com/psoc>.

Figure 12. Voltage versus CPU Frequency

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Table 11. Absolute Maximum Ratings

Symbol	Description	Conditions	Min	Typ	Max	Units
T _{STG}	Storage temperature	Higher storage temperatures reduce data retention time. Recommended Storage Temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 85 °C degrades reliability.	-55	+25	+125	°C
V _{DD}	Supply voltage relative to V _{SS}	—	-0.5	—	+6.0	V
V _{IO}	DC input voltage	—	V _{SS} - 0.5	—	V _{DD} + 0.5	V
V _{IOZ}	DC voltage applied to tristate	—	V _{SS} - 0.5	—	V _{DD} + 0.5	V
I _{MIO}	Maximum current into any port pin	—	-25	—	+50	mA
ESD	Electro static discharge voltage	Human body model ESD	2000	—	—	V
LU	Latch-up current	In accordance with JESD78 standard	—	—	200	mA

Operating Temperature

Table 12. Operating Temperature

Symbol	Description	Conditions	Min	Typ	Max	Units
T _A	Ambient temperature	—	-40	—	+85	°C
T _C	Commercial temperature range	—	0	—	70	°C
T _J	Operational die temperature	The temperature rise from ambient to junction is package specific. Refer the table Thermal Impedances per Package on page 34 . The user must limit the power consumption to comply with this requirement.	-40	—	+100	°C

DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 13. DC Chip-Level Specifications

Symbol	Description	Conditions	Min	Typ	Max	Units
V_{DD} [31, 32, 33, 34]	Supply voltage	Refer the table DC POR and LVD Specifications on page 23	1.71	–	5.50	V
I_{DD24}	Supply current, IMO = 24 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 24 MHz. CapSense running at 12 MHz, no I/O sourcing current	–	3.32	4.00	mA
I_{DD12}	Supply current, IMO = 12 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 12 MHz. CapSense running at 12 MHz, no I/O sourcing current	–	1.86	2.60	mA
I_{DD6}	Supply current, IMO = 6 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 6 MHz. CapSense running at 6 MHz, no I/O sourcing current	–	1.13	1.80	mA
I_{SB0}	Deep sleep current	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	0.10	0.50	μA
I_{SB1}	Standby current with POR, LVD and sleep timer	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	1.07	1.50	μA

Notes

31. When V_{DD} remains in the range from 1.71 V to 1.9 V for more than 50 μsec, the slew rate when moving from the 1.71 V to 1.9 V range to greater than 2 V must be slower than 1 V/500 μsec to avoid triggering POR. The only other restriction on slew rates for any other voltage range or transition is the SR_{POWER_UP} parameter.
32. If powering down in standby sleep mode, to properly detect and recover from a V_{DD} brown out condition any of the following actions must be taken:
 - a. Bring the device out of sleep before powering down.
 - b. Assure that V_{DD} falls below 100 mV before powering back up.
 - c. Set the No Buzz bit in the OSC_CR0 register to keep the voltage monitoring circuit powered during sleep.
 - d. Increase the buzz rate to assure that the falling edge of V_{DD} is captured. The rate is configured through the PSSDC bits in the SLP_CFG register.
 For the referenced registers, refer to the *CY8C20x36 Technical Reference Manual*. In deep sleep mode, additional low power voltage monitoring circuitry allows V_{DD} brown out conditions to be detected for edge rates slower than 1V/ms.
33. AFor USB mode, the V_{DD} supply for bus-powered application should be limited to 4.35V-5.35V. For self-powered application, V_{DD} should be 3.15 V-3.45 V.
34. For proper CapSense block functionality, if the drop in V_{DD} exceeds 5% of the base V_{DD} , the rate at which V_{DD} drops should not exceed 200 mV/s. Base V_{DD} can be between 1.8 V and 5.5 V

DC GPIO Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 3.0 V to 5.5 V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, 2.4 V to 3.0 V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 1.71 V to 2.4 V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3 V at 25 °C and are for design guidance only.

Figure 15. Definition for Timing for Fast/Standard Mode on the I²C Bus

Note

41. A Fast-Mode I²C-bus device can be used in a standard mode I²C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I²C-bus specification) before the SCL line is released.

Packaging Information

This section illustrates the packaging specifications for the CY8C20x36A/46A/66A/96A PSoC device, along with the thermal impedances for each package.

Important Note Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

48 Pin SSOP	220 °C	260 °C
48 Pin QFN	240 °C	260 °C
30 Ball WLCSP	240 °C	260 °C

Note

42. $T_J = T_A + \text{Power} \times \theta_{JA}$.

43. To achieve the thermal impedance specified for the QFN package, the center thermal pad must be soldered to the PCB ground plane.

44. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220 ± 5 °C with Sn-Pb or 245 ± 5 °C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications

Development Tool Selection

Software

PSoC Designer™

At the core of the PSoC development software suite is PSoC Designer, used to generate PSoC firmware applications. PSoC Designer is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows XP and Windows Vista.

This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and built-in support for third-party assemblers and C compilers. PSoC Designer also supports C language compilers developed specifically for the devices in the PSoC family. PSoC Designer is available free of charge at <http://www.cypress.com/psocdesigner> and includes a free C compiler.

PSoC Designer Software Subsystems

You choose a base device to work with and then select different onboard analog and digital components called user modules that use the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters. You configure the user modules for your chosen application and connect them to each other and to the proper pins. Then you generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration allows for changing configurations at run time. Code Generation Tools PSoC Designer supports multiple third-party C compilers and assemblers. The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. The choice is yours.

Assemblers. The assemblers allow assembly code to be merged seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices. The optimizing C compilers provide all the features of C tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

PSoC Designer has a debug environment that provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write I/O registers, read and write CPU registers, set and clear break-points, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

In-Circuit Emulator

A low cost, high functionality In-Circuit Emulator (ICE) is available for development support. This hardware has the capability to program single devices. The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24MHz) operation.

Standard Cypress PSoC IDE tools are available for debugging the CY8C20x36A/46A/66A/96A family of parts. However, the additional trace length and a minimal ground plane in the Flex-Pod can create noise problems that make it difficult to debug the design. A custom bonded On-Chip Debug (OCD) device is available in a 48-pin QFN package. The OCD device is recommended for debugging designs that have high current and/or high analog accuracy requirements. The QFN package is compact and is connected to the ICE through a high density connector.

PSoC Programmer

PSoC Programmer is flexible enough and is used on the bench in development and is also suitable for factory programming. PSoC Programmer works either as a standalone programming application or operates directly from PSoC Designer. PSoC Programmer software is compatible with both PSoC ICE Cube In-Circuit Emulator and PSoC MiniProg. PSoC programmer is available free of cost at <http://www.cypress.com/psocprogrammer..>

Development Kits

All development kits are sold at the Cypress Online Store.

CY3215-DK Basic Development Kit

The CY3215-DK is for prototyping and development with PSoC Designer. This kit supports in-circuit emulation and the software interface enables users to run, halt, and single step the processor and view the content of specific memory locations. PSoC Designer supports the advance emulation features also. The kit includes:

- PSoC Designer Software CD
- ICE-Cube In-Circuit Emulator
- ICE Flex-Pod for CY8C29x66A Family
- Cat-5 Adapter
- Mini-Eval Programming Board
- 110 ~ 240 V Power Supply, Euro-Plug Adapter
- iMAGEcraft C Compiler (Registration Required)
- ISSP Cable
- USB 2.0 Cable and Blue Cat-5 Cable
- 2 CY8C29466A-24PXI 28-PDIP Chip Samples

Evaluation Tools

All evaluation tools are sold at the Cypress Online Store.

CY3210-MiniProg1

The CY3210-MiniProg1 kit enables the user to program PSoC devices via the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC via a provided USB 2.0 cable. The kit includes:

- MiniProg Programming Unit
- MiniEval Socket Programming and Evaluation Board
- 28-Pin CY8C29466A-24PXI PDIP PSoC Device Sample
- 28-Pin CY8C27443A-24PXI PDIP PSoC Device Sample
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3210-PSoCEval1

The CY3210-PSoCEval1 kit features an evaluation board and the MiniProg1 programming unit. The evaluation board includes an LCD module, potentiometer, LEDs, and plenty of bread-boarding space to meet all of your evaluation needs. The kit includes:

- Evaluation Board with LCD Module
- MiniProg Programming Unit
- 28-Pin CY8C29466A-24PXI PDIP PSoC Device Sample (2)
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3280-20x66 Universal CapSense Controller

The CY3280-20X66 CapSense Controller Kit is designed for easy prototyping and debug of CY8C20xx6A CapSense Family designs with pre-defined control circuitry and plug-in hardware. Programming hardware and an I2C-to-USB bridge are included for tuning and data acquisition.

The kit includes:

- CY3280-20x66 CapSense Controller Board
- CY3240-I2USB Bridge
- CY3210 MiniProg1 Programmer
- USB 2.0 Retractable Cable
- CY3280-20x66 Kit CD

Device Programmers

All device programmers are purchased from the Cypress Online Store.

CY3216 Modular Programmer

The CY3216 Modular Programmer kit features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- Modular Programmer Base
- Three Programming Module Cards
- MiniProg Programming Unit
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3207ISSP In-System Serial Programmer (ISSP)

The CY3207ISSP is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production programming environment. Note that CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 Programmer Unit
- PSoC ISSP Software CD
- 110 ~ 240 V Power Supply, Euro-Plug Adapter
- USB 2.0 Cable

Third Party Tools

Several tools have been specially designed by the following third-party vendors to accompany PSoC devices during development and production. Specific details for each of these tools can be found at <http://www.cypress.com> under Documentation > Evaluation Boards.

Build a PSoC Emulator into Your Board

For details on how to emulate your circuit before going to volume production using an on-chip debug (OCD) non-production PSoC device, refer Application Note [Debugging - Build a PSoC Emulator into Your Board – AN2323](#).

Note

45. Flex-Pod kit includes a practice flex-pod and a practice PCB, in addition to two flex-pods.

46. Foot kit includes surface mount feet that can be soldered to the target PCB.

47. Programming adapter converts non-DIP package to DIP footprint. Specific details and ordering information for each of the adapters can be found at <http://www.emulation.com>.

Ordering Information

The following table lists the CY8C20x36A/46A/66A/96A PSoC devices' key package features and ordering codes..

Note

48. Dual-function Digital I/O Pins also connect to the common analog mux.

Acronyms

Acronyms Used

The following table lists the acronyms that are used in this document.

Table 39. Acronyms Used in this Document

Acronym	Description
AC	alternating current
ADC	analog-to-digital converter
API	application programming interface
CMOS	complementary metal oxide semiconductor
CPU	central processing unit
DAC	digital-to-analog converter
DC	direct current
EOP	end of packet
FSR	full scale range
GPIO	general purpose input/output
GUI	graphical user interface
I ² C	inter-integrated circuit
ICE	in-circuit emulator
IDAC	digital analog converter current
ILO	internal low speed oscillator
IMO	internal main oscillator
I/O	input/output
ISSP	in-system serial programming
LCD	liquid crystal display
LDO	low dropout (regulator)
LSB	least-significant bit
LVD	low voltage detect
MCU	micro-controller unit
MIPS	mega instructions per second
MISO	master in slave out
MOSI	master out slave in
MSB	most-significant bit
OCD	on-chip debugger
POR	power on reset
PPOR	precision power on reset
PSRR	power supply rejection ratio
PWRSYS	power system
PSoC®	Programmable System-on-Chip
SLIMO	slow internal main oscillator
SRAM	static random access memory
SNR	signal to noise ratio
QFN	quad flat no-lead
SCL	serial I ² C clock
SDA	serial I ² C data
SDATA	serial ISSP data
SPI	serial peripheral interface
SS	slave select
SSOP	shrink small outline package
TC	test controller
USB	universal serial bus
USB D+	USB Data +
USB D-	USB Data-
WLCSP	wafer level chip scale package
XTAL	crystal

Units of Measure

[Table 40](#) lists all the abbreviations used to measure the PSoC devices.

Table 40. Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
dB	decibels
fF	femto farad
g	gram
Hz	hertz
KB	1024 bytes
Kbit	1024 bits
KHz	kilohertz
Ksps	kilo samples per second
kΩ	kilohm
MHz	megahertz
MΩ	megaohm
μA	microampere
μF	microfarad
μH	microhenry
μs	microsecond
μW	microwatts
mA	milli-ampere
ms	milli-second
mV	milli-volts
nA	nanoampere
ns	nanosecond
nV	nanovolts
W	ohm
pA	picoampere
pF	picofarad
pp	peak-to-peak
ppm	parts per million
ps	picosecond
sps	samples per second
s	sigma: one standard deviation
V	volts
W	watt

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

Glossary

Crosspoint connection	Connection between any GPIO combination via analog multiplexer bus.
Differential non-linearity	Ideally, any two adjacent digital codes correspond to output analog voltages that are exactly one LSB apart. Differential non-linearity is a measure of the worst case deviation from the ideal 1 LSB step.
Hold time	Hold time is the time following a clock event during which the data input to a latch or flip-flop must remain stable in order to guarantee that the latched data is correct.
I ² C	It is a serial multi-master bus used to connect low speed peripherals to MCU.
Integral nonlinearity	It is a term describing the maximum deviation between the ideal output of a DAC/ADC and the actual output level.
Latch-up current	Current at which the latch-up test is conducted according to JESD78 standard (at 125 degree celsius)
Power supply rejection ratio (PSRR)	The PSRR is defined as the ratio of the change in supply voltage to the corresponding change in output voltage of the device.
Scan	The conversion of all sensor capacitances to digital values.
Setup time	Period required to prepare a device, machine, process, or system for it to be ready to function.
Signal-to-noise ratio	The ratio between a capacitive finger signal and system noise.
SPI	Serial peripheral interface is a synchronous serial data link standard.

Revision	ECN	Origin of Change	Submission Date	Description of Change
**	2737924	SNV	07/14/09	New silicon and document
*A	2764528	MATT	09/16/2009	Updated AC Chip Level Specifications Updated ADC User Module Electrical Specifications table Added Note 5. Added SR _{POWER_UP} parameter. Updated Ordering information. Updated Capacitance on Crystal Pins
*B	2803229	VZD	11/10/09	Added Contents on page 3 . Added Note 6 on page 20. Edited Features section to include reference to Incremental ADC.
*C	2846083	DST/KEJO	01/12/2010	Updated AC Programming Specifications on page 27 per CDT 56531 Updated Idd typical values in DC Chip-Level Specifications on page 18 . Added 30-pin WLCSP pin and package details Added Contents on page 2.
*D	2935141	KEJO/ISW/SSHH	03/05/2010	Updated Features on page 1 . Added SmartSense™ on page 4 . Updated PSoC® Functional Overview on page 4 . Removed SNR statement regarding on page 4 (Analog Multiplexer section). Updated on page 5 with the I2C enhanced slave interface point. Removed references to “system level” in Designing with PSoC Designer on page 6 . Changed TC CLK and TC DATA to ISSP CLK and ISSP DATA respectively in all the pinouts. Modified notes in Pinouts. Updated 30-ball pin diagram. Removed IMO frequency trim options diagram in Electrical Specifications on page 17 . Updated and formatted values in DC and AC specifications. Updated Ordering information table. Updated 48-pin SSOP package diagram. Added 30-Ball WLCSP package spec 001-50669. Removed AC Analog Mux Bus Specifications section. Added SPI Master and Slave mode diagrams. Modified Definition for Timing for Fast/Standard Mode on the I2C Bus on page 28 . Updated Thermal Impedances on page 34 . Combined Development Tools with Development Tool Selection on page 35 . Removed references to “system level”. Updated Evaluation Tools on page 36 . Added Ordering Code Definitions on page 39 . Updated Acronyms Used on page 40 . Added Glossary and Reference Documents on page 40 Changed datasheet status from Preliminary to Final
*E	3043291	SAAC	09/30/10	1) Change: Added the line “Supports SmartSense” under the “Low power CapSense® block” bullet in the Features section. Areas affected: Features section. Impact: Helps to know that this part has the feature of Auto Tuning. 2) Change: Replaced pod MPNs. Areas affected: Foot kit column of table 37. 3) Change: Template and Styles update. Areas affected: Entire datasheet. Impact: Datasheet adheres to Cypress standards.
