## Low Voltage Quad 2-Channel Multiplexer with 3.6 V Tolerant Inputs and Outputs

The TC74VCX257 is a high performance CMOS multiplexer which is guaranteed to operate from 1.2-V to 3.6-V. Designed for use in 1.5 V, 1.8 V, 2.5 V or 3.3 V systems, it achieves high speed operation while maintaining the CMOS low power dissipation.

It is also designed with over voltage tolerant inputs and outputs up to 3.6 V.

It consists of four 2-input digital multiplexers with common SELECT and OUTPUTENABLE (OE).

If OE is set high the outputs are held in a high-impedance state. The SELECT decoding determines whether the A or B inputs get routed to their corresponding Y outputs.

All inputs are equipped with protection circuits against static discharge.

## Absolute Maximum Ratings (Note 1)

Characteristics	Symbol	Rating	Unit
Power supply voltage	$V_{CC}$	-0.5~4.6	V
DC input voltage	$V_{IN}$	-0.5~4.6	V
DC output voltage	$V_{OUT}$	-0.5~4.6 (Note 2)	V
		-0.5~ $V_{CC} + 0.5$ (Note 3)	
Input diode current	$I_{IK}$	-50	mA
Output diode current	$I_{OK}$	±50 (Note 4)	mA
DC output current	$I_{OUT}$	±50	mA
Power dissipation	$P_D$	180	mW
DC $V_{CC}$ /ground current	$I_{CC}/I_{GND}$	±100	mA
Storage temperature	$T_{stg}$	-65~150	°C

Note 1: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.

Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.

Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note 2: Off-state

Note 3: High or low state.  $I_{OUT}$  absolute maximum rating must be observed.

Note 4:  $V_{OUT} < GND$ ,  $V_{OUT} > V_{CC}$

## Operating Ranges (Note 1)

Figure 1

The diagram illustrates the timing characteristics of a CMOS inverter. It shows three signals: Input, Non-Inverting Output, and Inverting Output. The input signal is a square wave with a rise time  $t_r = 2.0 \text{ ns}$  and a fall time  $t_f = 2.0 \text{ ns}$ . The non-inverting output signal is a square wave that is high when the input is high and low when the input is low. The inverting output signal is a square wave that is low when the input is high and high when the input is low. The output signals are labeled with  $V_{OH}$  (output high voltage),  $V_{OL}$  (output low voltage), and  $V_M$  (mid-level voltage). The propagation delay from input to non-inverting output is  $t_{pLH}$  (low-to-high) and  $t_{pHL}$  (high-to-low). The propagation delay from input to inverting output is  $t_{pHL}$  (high-to-low) and  $t_{pLH}$  (low-to-high). The output signals are also labeled with  $V_{IH}$  (input high voltage) and  $V_{IL}$  (input low voltage).
