

Low Noise, Low Power, SPI® Bus, 128 Taps, Wiper Only

The ISL22429 integrates two digitally controlled potentiometers (DCP) and non-volatile memory on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the SPI serial interface. Each potentiometer has an associated volatile Wiper Register (WR) and a non-volatile Initial Value Register (IVR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper. At power-up the device recalls the contents of the DCP's IVR to the corresponding WR.

The DCP can be used as a voltage divider in a wide variety of applications including control, parameter adjustments, AC measurement and signal processing.

Pinout

Features

- Two potentiometers in one package
- 128 resistor taps
- SPI serial interface
- Non-volatile storage of wiper position
- Wiper resistance: 70Ω typical @ 3.3V
- Shutdown mode
- Shutdown current 5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ or 10kΩ total resistance
- High reliability
 - Endurance: 1,000,000 data changes per bit per register
 - Register data retention: 50 years @ T ≤ +55°C
- 10 Lead MSOP
- Pb-free plus anneal product (RoHS compliant)

Ordering Information

PART NUMBER	PART MARKING	RESISTANCE OPTION (kΩ)	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #
ISL22429UFU10Z (Notes 1, 2)	429UZ	50	-40 to +125	10 Ld MSOP (Pb-free)	M10.118
ISL22429WUFU10Z (Notes 1, 2)	429WZ	10	-40 to +125	10 Ld MSOP (Pb-free)	M10.118

NOTES:

1. Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. Add "-TK" suffix for 1,000 Tape and Reel option

Pin Descriptions

MSOP PIN	SYMBOL	DESCRIPTION
1	NC	
2	SCK	SPI interface clock input
3	SDO	Open drain SPI interface data output
4	GND	Device ground pin
5	RW1	"Wiper" terminal of DCP1
6	$\overline{\text{CS}}$	Chip Select active low input
7	SDI	SPI interface data input
8	V _{CC}	Power supply pin
9	$\overline{\text{SHDN}}$	Shutdown active low input
10	RW0	"Wiper" terminal of DCP0

Absolute Maximum Ratings

Storage Temperature	-65°C to +150°C
Voltage at any Digital Interface Pin with Respect to GND	-0.3V to $V_{CC} + 0.3$
V_{CC}	-0.3V to +6V
Voltage at any DCP pin with Respect to GND	-0.3V to V_{CC}
Lead Temperature (Soldering, 10s)	+300°C
I_W (10s)	±6mA
Latchup (Note 4)	Class II, Level B @ +125°C
ESD (HBM)	2.5kV
(CDM)	1kV

Thermal Information

Thermal Resistance (Typical, Note 3)	θ_{JA} (°C/W)
10 Lead MSOP	120
Maximum Junction Temperature (Plastic Package)	+150°C

Recommended Operating Conditions

Ambient Temperature	-40°C to +125°C
V_{CC} Voltage for DCP Operation	2.7V to 5.5V
Wiper Current	-3mA to 3mA
Power Rating	5mW

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

- θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
- Jedec Class II pulse conditions and failure criterion used. Level B exceptions are: using a max positive pulse of 6.5V on the SHDN pin, and using a max negative pulse of -0.8V for all pins.

Analog Specifications Over recommended operating conditions unless otherwise stated.

NOTES:

- Typical values are for $T_A = +25^\circ\text{C}$ and 3.3V supply voltage.
- LSB: $[V(RW)_{127} - V(RW)_0]/127$. $V(RW)_{127}$ and $V(RW)_0$ are $V(RW)$ for the DCP register set to 7F hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
- ZS error = $V(RW)_0/\text{LSB}$.
- FS error = $[V(RW)_{127} - V_{CC}]/\text{LSB}$.
- $\text{DNL} = [V(RW)_i - V(RW)_{i-1}]/\text{LSB} - 1$, for $i = 1$ to 127. i is the DCP register setting.
- $\text{INL} = [V(RW)_i - i \cdot \text{LSB} - V(RW)]/\text{LSB}$ for $i = 1$ to 127
- $V_{\text{MATCH}} = [V(RW)_x - V(RW)_y]/\text{LSB}$, for $i = 1$ to 127, $x = 0$ to 3 and $y = 0$ to 3.
- $T_{CV} = \frac{\text{Max}(V(RW)_i) - \text{Min}(V(RW)_i)}{[\text{Max}(V(RW)_i) + \text{Min}(V(RW)_i)]/2} \times \frac{10^6}{165^\circ\text{C}}$ for $i = 16$ to 112 decimal, $T = -40^\circ\text{C}$ to $+125^\circ\text{C}$. $\text{Max}()$ is the maximum value of the wiper voltage and $\text{Min}()$ is the minimum value of the wiper voltage over the temperature range.
- t_{WC} is the time from the end of a Write sequence of SPI serial interface, to the end of the self-timed internal non-volatile write cycle.
- R_{pu} is specified for the highest data rate transfer for the device. Higher value pull-up can be used at lower data rates.
- This parameter is not 100% tested.

Pin Description

Potentiometer Pins

RWi (i = 0, 1)

RWi is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the WRi register.

SHDN

The $\overline{\text{SHDN}}$ pin forces the resistors to end-to-end open circuit condition and shorts RWi to GND. When $\overline{\text{SHDN}}$ is returned to logic high, the previous latch settings put RWi at the same resistance setting prior to shutdown. This pin is logically OR'd with SHDN bit in ACR register. SPI interface is still available in shutdown mode and all registers are accessible. This pin must remain HIGH for normal operation.

FIGURE 11. DCP CONNECTION IN SHUTDOWN MODE

Bus Interface Pins

Serial Clock (SCK)

This is the serial clock input of the SPI serial interface.

Serial Data Output (SDO)

The SDO is an open drain serial data output pin. During a read cycle, the data bits are shifted out at the falling edge of the serial clock SCK, while the $\overline{\text{CS}}$ input is low.

SDO requires an external pull-up resistor for proper operation.

Serial Data Input (SDI)

The SDI is the serial data input pin for the SPI interface. It receives device address, operation code, wiper address and data from the SPI external host device. The data bits are shifted in at the rising edge of the serial clock SCK, while the $\overline{CS}$ input is low.

Chip Select ($\overline{CS}$)

$\overline{CS}$ LOW enables the ISL22429, placing it in the active power mode. A HIGH to LOW transition on $\overline{CS}$ is required prior to the start of any operation after power up. When $\overline{CS}$ is HIGH, the ISL22429 is deselected and the SDO pin is at high impedance, and (unless an internal write cycle is underway) the device will be in the standby state.

Principles of Operation

The ISL22429 is an integrated circuit incorporating two DCPs with its associated registers, non-volatile memory and the SPI serial interface providing direct communication between host and potentiometers and memory. The resistor array is comprised of individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The electronic switches on the device operate in a “make before break” mode when the wiper changes tap positions.

When the device is powered down, the last value stored in IVR_i will be maintained in the non-volatile memory. When power is restored, the contents of the IVR_i is recalled and loaded into the corresponding WR_i to set the wiper to the initial value.

DCP Description

Each DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer and internally connected to V_{CC} and GND. The RW pin of each DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by volatile Wiper Register (WR). Each DCP has its own WR. When the WR of a DCP contains all zeroes (WR[6:0] = 00h), its wiper terminal (RW) is closest to GND. When the WR register of a DCP contains all ones (WR[6:0] = 7Fh), its wiper terminal (RW) is closest to V_{CC}. As the value of the WR increases from all zeroes (0) to all ones (127 decimal), the wiper moves monotonically from the position closest to GND to the closest to V_{CC}.

While the ISL22429 is being powered up, all two WRs are reset to 40h (64 decimal), which locates RW roughly at the center between GND and V_{CC}. After the power supply voltage becomes large enough for reliable non-volatile

memory reading, all WRs will be reload with the value stored in corresponding non-volatile Initial Value Registers (IVRs).

The SPI interface register address bits have to be set to 0000b or 0001b to access the WR of DCP0 or DCP1 respectively. The WR_i and IVR_i can be read or written to directly using the SPI serial interface as described in the following sections.

Memory Description

The ISL22429 contains seven non-volatile and three volatile 8-bit registers. The memory map of ISL22429 is on Table 1. The two non-volatile registers (IVR_i) at address 0 and 1, contain initial wiper value and volatile registers (WR_i) contain current wiper position. In addition, five non-volatile General Purpose registers from address 2 to address 6 are available.

TABLE 1. MEMORY MAP

ADDRESS	NON-VOLATILE	VOLATILE
8	—	ACR
7	Reserved	
6	General Purpose	Not Available
5	General Purpose	Not Available
4	General Purpose	Not Available
3	General Purpose	Not Available
2	General Purpose	Not Available
1	IVR1	WR1
0	IVR0	WR0

The non-volatile IVR_i and volatile WR_i registers are accessible with the same address.

The Access Control Register (ACR) contains information and control bits described below in Table 2.

The VOL bit (ACR[7]) determines whether the access is to wiper registers WR_i or initial value registers IVR_i.

TABLE 2. ACCESS CONTROL REGISTER (ACR)

BIT #	7	6	5	4	3	2	1	0
Bit Name	VOL	SHDN	WIP	0	0	0	0	0

If VOL bit is 0, the non-volatile IVR_i register is accessible. If VOL bit is 1, only the volatile WR_i is accessible. Note, value is written to IVR_i register also is written to the WR_i. The default value of this bit is 0.

The SHDN bit (ACR[6]) disables or enables Shutdown mode. This bit is logically OR'd with $\overline{SHDN}$ pin. When this bit is 0, DCPs are in Shutdown mode. The default value of SHDN bit is 1.

The WIP bit (ACR[5]) is read only bit. It indicates that non-volatile write operation is in progress. The WIP bit can be read repeatedly after a non-volatile write to determine if the write has been completed. It is impossible to write to the IVR_i, WR_i or ACR while WIP bit is 1.

SPI Serial Interface

The ISL22429 supports an SPI serial protocol, mode 0. The device is accessed via the SDI input and SDO output with data clocked in on the rising edge of SCK, and clocked out on the falling edge of SCK. $\overline{CS}$ must be LOW during communication with the ISL22429. SCK and $\overline{CS}$ lines are controlled by the host or master. The ISL22429 operates only as a slave device.

All communication over the SPI interface is conducted by sending the MSB of each byte of data first.

Protocol Conventions

The first byte sent to the ISL22429 from the SPI host is the Identification Byte. A valid Identification Byte contains 0101 as the four MSBs, with the following four bits set to 0.

TABLE 3. IDENTIFICATION BYTE FORMAT

0	1	0	1	0	0	0	0
(MSB)				(LSB)			

The next byte sent to the ISL22429 contains the instruction and register pointer information. The four MSBs are the instruction and four LSBs are register address (see Table 4).

TABLE 4. IDENTIFICATION BYTE FORMAT

7	6	5	4	3	2	1	0
I3	I2	I1	I0	R3	R2	R1	R0

There are only two valid instruction sets:

1011(binary) - is a Read operation

1100(binary) - is a Write operation

Write Operation

A Write operation to the ISL22429 is a three-byte operation. It requires first, the $\overline{CS}$ transition from HIGH to LOW, then a valid Identification Byte, then a valid instruction byte

following by Data Byte is sent to SDI pin. The host terminates the write operation by pulling the $\overline{CS}$ pin from LOW to HIGH. For a write to addresses 0000b or 0001b, the MSB at address 8 (ACR[7]) determines if the Data Byte is to be written to volatile or both volatile and non-volatile registers. Refer to "Memory Description" and Figure 12.

Device can receive more than one byte of data by auto incrementing the address after each received byte. Note after reaching the address 0110b, the internal pointer "rolls over" to address 0000b.

The internal non-volatile write cycle starts after rising edge of $\overline{CS}$ and takes up to 20ms. Thus, non-volatile registers must be written individually.

Read Operation

A read operation to the ISL22429 is a three-byte operation. It requires first, the $\overline{CS}$ transition from HIGH to LOW, then a valid Identification Byte, then a valid instruction byte following by "dummy" Data Byte is sent to SDI pin. The SPI host reads the data from SDO pin on falling edge of SCK. The host terminates the read operation by pulling the $\overline{CS}$ pin from LOW to HIGH (see Figure 13).

The ISL22429 will provide the Data Bytes to the SDO pin as long as SCK is provided by the host from the registers indicated by an internal pointer. This pointer initial value is determined by the register address in the Read operation instruction, and increments by one during transmission of each Data Byte. After reaching the memory location 0110b, the pointer "rolls over" to 0000b, and the device continues to output the data for each received SCK clock.

In order to read back the non-volatile IVR, it is recommended that the application reads the ACR first to verify the WIP bit is 0. If the WIP bit (ACR[5]) is not 0, the host should repeat its reading sequence again.

FIGURE 12. THREE BYTE WRITE SEQUENCE

FIGURE 13. THREE BYTE READ SEQUENCE

Applications Information

Communicating with ISL22429

Communication with ISL22429 proceeds using SPI interface through the ACR (address 1000b), IVRi (addresses 0000b, 0001b) and WRi (addresses 0000b, 0001b) registers.

The wiper of the potentiometer is controlled by the WRi register. Writes and reads can be made directly to these registers to control and monitor the wiper position without

any non-volatile memory changes. This is done by setting MSB bit at address 1000b to 1.

The non-volatile IVRi stores the power up value of the wiper. IVRs are accessible when MSB bit at address 1000b is set to 0. Writing a new value to the IVRi register will set a new power up position for the wiper. Also, writing to this register will load the same value into the corresponding WRi as the IVRi. Reading from the IVRi will not change the WRi, if its contents are different.

Examples:

B. Reading from the WR:

This sequence will read the value from the WR1 (volatile):

Write to ACR first to access the volatile WRs

Send the ID byte, Instruction Byte, then the Data byte

0	1	0	1	0	0	0	0	0	1	1	0	0	1	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

(Sent to SDI)

Read the data from WR1 (Addr 0001b)

Send the ID byte, Instruction Byte, then Read the Data byte

0	1	0	1	0	0	0	0	0	1	0	1	1	0	0	0	1	x	x	x	x	x	x	x	x	x	x	x	x
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

(Out on SDO)

A. Writing to the IVR:

This sequence will write a new value (77h) to the IVR0(non-volatile):

Set the ACR (Addr 1000b) for NV write (40h)

Send the ID byte, Instruction Byte, then the Data byte

0	1	0	1	0	0	0	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

(Sent to SDI)

Set the IVR0 (Addr 0000b) to 77h

Send the ID byte, Instruction Byte, then the Data byte

0	1	0	1	0	0	0	0	0	1	1	0	0	0	0	0	0	0	1	1	1	1	0	1	1	1	1	1	1
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

(Sent to SDI)

NOTES:

- These package dimensions are within allowable dimensions of JEDEC MO-187BA.
- Dimensioning and tolerancing per ANSI Y14.5M-1994.
- Dimension "D" does not include mold flash, protrusions or gate burrs and are measured at Datum Plane. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E1" does not include interlead flash or protrusions and are measured at Datum Plane. $\boxed{-H-}$ Interlead flash and protrusions shall not exceed 0.15mm (0.006 inch) per side.
- Formed leads shall be planar with respect to one another within 0.10mm (.004) at seating Plane.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm (0.0027 inch).
- Datums $\boxed{-A-}$ and $\boxed{-B-}$ to be determined at Datum plane $\boxed{-H-}$.
- Controlling dimension: MILLIMETER. Converted inch dimensions are for reference only

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.
