MM54HC155/MM74HC155 Dual 2-To-4 Line Decoder/Demultiplexers

General Description

The MM54HC155/MM74HC155 is a high speed silicon-gate CMOS decoder/demultiplexer. It utilizes advanced silicon-gate CMOS technology and features dual 1-line-to-4-line demultiplexers with independent strobes and common binary-address inputs. When both sections are enabled by the strobes, the common address inputs sequentially select and route associated input data to the appropriate output of each section. The individual strobes permit activating or inhibiting each of the 4-bit sections as desired. Data applied to input C1 is inverted at its outputs and data applied to C2 is non-inverted at its outputs. The inverter following the C1 data input permits use as a 3-to-8-line decoder, or 1-to-8-line demultiplexer, without gating.

All inputs to the decoder are protected from damage due to electrostatic discharge by diodes to V_{CC} and Ground.

The device is capable of driving 10 low power Schottky TTL equivalent loads.

The MM54HC155/MM74HC155 is functionally and pin equivalent to the 54LS155/74LS155 with the advantage of reduced power consumption.

Features

- Applications
  - Dual 2-to-4-line decoder
  - Dual 1-to-4-line demultiplexer
  - 3-to-8-line decoder
  - 1-to-8-line demultiplexer
- Typical propagation delay: 22 ns
- Low quiescent current: 80 μA maximum (74HC series)
- Wide operating range: 2V–6V

Note 1: Absolute Maximum Ratings are those values beyond which damage to the device may occur.

Note 2: Unless otherwise specified, all voltages are referenced to ground.

Note 3: Power Dissipation temperature derating — plastic "N" package: −12 mW/°C from 65°C to 85°C; ceramic "J" package: −12 mW/°C from 100°C to 125°.

Note 4: For a power supply of 5V ±10% the worst case output voltages (V_{OH} and V_{OL}) occur for HC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case V_{IH} and V_{IL} occur at V_{CC} = 5.5V and 4.5V respectively. (The V_{IH} value at 5.5V is 3.85V.) The worst case leakage current (I_{IN}, I_{CC} and I_{OZ}) occur for CMOS at the higher voltage and so the 6.0V values should be used.

**V_{IL} limits are currently tested at 20% of V_{CC}. The above V_{IL} specification (30% of V_{CC}) will be implemented no later than Q1, CY'89.
