TOIREX

ETR0316_003

High Speed "Green Operation" LDO Voltage Regulators

■ GENERAL DESCRIPTION

GO-Compatible

The XC6207 series are precise, low noise, high speed, and low dropout regulators with green operation (GO) function. They are fabricated using Torex's CMOS process. Performance features of the series include high ripple rejection and low dropout voltage, and the series include a reference voltage source, an error amplifier, a current limiter, and a phase compensation circuit. Output voltage is selectable in 50mV increments within a range of 1.2V~5.0V, using laser trimming technologies. The series' output stabilization capacitor (CL) is also compatible with low ESR ceramic capacitors. GO provides high speed operation, low power consumption and high efficiencies by automatically switching between a high speed mode (HS) and a power save mode (PS) depending upon the load current level. The switching point of the GO to the output current is being fixed inside the IC. The IC operates when the GO pin is low-level. When only high-speed operation is required, it can be fixed by inputting a high level signal to the GO pin, thus providing operating conditions with the most suitable level of supply current for the application. The CE function enables the output to be turned off resulting in greatly reduced power consumption. In this state, with the XC6207B series, the IC turns on the internal switch located between the VOUT and VSS pins. This short enables the electric charge at the output capacitor (CL) to be discharged via the internal auto-discharge resistance, and as a result the VOUT pin quickly returns to the VSS level. The constant current limit circuit and the current limiter's foldback circuit also operate as a short circuit protection for the output current limiter and the output pin.

■ APPLICATIONS

- Cellular phones
- Cordless phones,
Wireless communication equipment
- Portable games
- Cameras, VCRs
- Portable AV equipment
- PDAs

■ FEATURES

- Maximum Output Current** : 300mA (Up to 380mA (TYP.))
- Dropout Voltage** : 40mV@ I_{OUT}=30mA
: 120mV@ I_{OUT}=100mA
- Operating Voltage Range** : 2.0V ~ 6.0V
- Output Voltage Setting Range** : 1.2V ~ 5.0V (50mV increments)
- Accuracy** : ±2% (HS Mode: V_{OUT} > 1.5V)
: + 2%, - 3% (PS Mode: V_{OUT} > 1.5V)
: ±30mV (HS Mode: V_{OUT} = 1.5V)
: +30mV, - 45mV (HS Mode: V_{OUT} = 1.5V)
- Low Power Consumption** : 5.5µA (TYP.) (PS Mode)
: 50µA (TYP.) (HS Mode)
- Stand-by Current** : Less than 0.1µA
- High Ripple Rejection** : 70dB @ 1kHz
- Operating Temperature Range** : - 40 ~ 85
- Low ESR Capacitor** : Ceramic capacitor compatible
- CMOS**
- Low Output Noise**
- Green Operation (GO) Function**
- CL High-Speed Auto-Discharge (XC6207B)**
- Packages** : SOT-89-5, SOT-25, USP-6C

■ TYPICAL APPLICATION CIRCUIT

■ TYPICAL PERFORMANCE CHARACTERISTICS

- Supply Current vs. Output Current

XC6207A182xx

PIN CONFIGURATION

USP-6C
(BOTTOM VIEW)

SOT-25
(TOP VIEW)

SOT-89-5
(TOP VIEW)

*The dissipation pad for the USP-6C package should be solder-plated in recommended mount pattern and metal masking so as to enhance mounting strength and heat release.
If the pad needs to be connected to other pins, it should be connected to the Vss (No. 5) pin.

PIN ASSIGNMENT

PIN NUMBER			PIN NAME	FUNCTIONS
USP-6C	SOT-25	SOT-89-5		
1	1	4	VIN	Power Input
2	-	-	NC	No Connection
3	5	5	VOUT	Output
4	4	1	GO	Green Operation Mode Switch
5	2	2	VSS	Ground
6	3	3	CE	ON/OFF Control

FUNCTIONS CHART

• CE pin

CE	FUNCTION
H	Operation
L	Stand-by

*For the XC6207B series, the output capacitor (C_L) is discharged via the internal auto-discharge resistance when the CE is at low level.

• GO pin

GO	FUNCTION
H	High Speed Mode
L	Green Operation (HS/PS Mode Automatic Switching) $I_{GO} \leq I_{OUT}$: High Speed Mode $I_{GOR} \geq I_{OUT}$: Power Save Mode

■ PRODUCT CLASSIFICATION

• Ordering Information

XC6207

DESIGNATOR	DESCRIPTION	SYMBOL	DESCRIPTION
	Type of Regulator	A	: CE High Active, no resistor for fixing pin's electrical potential, no C _L discharge resistor
		B	: CE High Active, no resistor for fixing pin's electrical potential, with C _L discharge resistor
	Output Voltage	12 ~ 50	: ex.) V _{OUT(T)} = 3.0V → = 3, = 0
	Output Accuracy	2	: Output voltage 100mV increments When HS mode, 1.2V < V _{OUT(T)} 1.5V : Accuracy ± 30mV 1.5V < V _{OUT(T)} 5.0V: Accuracy ± 2% When PS mode, 1.2V < V _{OUT(T)} 1.5V: Accuracy ± 30mV or - 45mV 1.5V < V _{OUT(T)} 5.0V: Accuracy ± 2% or - 3%
		A	: Output voltage 50mV increments When HS mode, 1.2V < V _{OUT(T)} 1.5V : Accuracy ± 30mV 1.5V < V _{OUT(T)} 5.0V: Accuracy ± 2% When PS mode, 1.2V < V _{OUT(T)} 1.5V: Accuracy ± 30mV or - 45mV 1.5V < V _{OUT(T)} 5.0V: Accuracy ± 2% or - 3%

CL Auto-Discharge Resistance ^(*)8)	Rdischg	VIN=6.0V, VOUT=6.0V, VCE=VGO=VSS	-	470	-	Ω	

NOTE:

- * 1: Unless otherwise stated, VIN=VOUT(T) + 1.0V.
- * 2: VOUT(T) = Specified output voltage
- * 3: VOUT(E) = Effective output voltage
(I.e. the output voltage when an amply stabilized "VOUT(T) + 1.0V" is provided at the VIN pin while maintaining a certain IOUT value.)
High Speed (HS) mode: The voltage of VGOH or more is input to the GO pin, or the voltage of VGOL or less is input to the GO pin when the output current is IGO or more.
Power Save (PS) mode: The voltage of VGOL or less is input to the GO pin when the output current is IGOR or less.
- * 4: $V_{dif} = \{V_{IN1}^{(*)6)} - V_{OUT1}^{(*)5)}\}$
- * 5: VOUT1=A voltage equal to 98% of the output voltage whenever an amply stabilized IOUT {VOUT(T)+1.0V} is input in the HS mode.
- * 6: VIN1=The input voltage when VOUT1 appears as Input Voltage is gradually decreased.
- * 7: With the GO pin input voltage, the fixed HS mode or Green Operation (GO) is selectable.
- * 8: For the XC6207B series only. The XC6207A series discharges by resistors R1 and R2 only as shown in the block diagrams.
- * 9: The rated value of the output voltage when VOUT(T) 1.5V is shown below.
HS mode : VOUT(T) -30mV VOUT(E) VOUT(T) +30mV
PS mode : VOUT(T) -45mV VOUT(E) VOUT(T) +30mV
- *10: Recommended conditions for CIN and CL
1.2V VOUT(T) < 1.8V: CIN=1.0 μF, CL=4.7 μF (ceramic cap.)
1.8V VOUT(T) < 2.5V: CIN=1.0 μF, CL=1.0 μF (ceramic cap.)
2.5V VOUT(T) 5.0V: CIN=2.2 μF, CL=1.0 μF (ceramic cap.)

■ OPERATIONAL EXPLANATION

<Output Voltage Control>

The voltage divided by resistors R1 & R2 is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET, which is connected to the V_{OUT} pin, is then driven by the subsequent output signal. The output voltage at the V_{OUT} pin is controlled & stabilized by a system of negative feedback. The current limit circuit and short protect circuit operate in relation to the level of output current. The GO function monitors the output current and switches a supply current to two values according to the level of output current. Further, the IC's internal circuitry can be shutdown via the CE pin's signal.

<Green Operation>

XC6207 series can be set as a fixed high-speed mode or a green operation (GO) mode via a signal to the green operation (GO) pin. Under the condition that the output current becomes I_{GOR} or less, the IC operates in the high speed mode (HS) when the GO pin is at high level and the IC operates in the power save (PS) mode when the GO pin is at low level. The GO mode enables the IC to switch automatically the supply current to the high speed (HS) mode or the power save (PS) mode according to the level of output current. While having both high-speed operation and low supply current state, the XC6207 series can acquire high efficiency. At the HS/PS automatic switching mode (GO mode), the switching point of the HS mode and the PS mode is being fixed inside the IC. When the output current becomes I_{GOR} 0.3mA (TYP.) or below, the mode changes automatically to the PS mode after the delay time of hundreds μ s, and it can reduce supply current in light load. For applications, most of portable equipment control the system current, which is the output current to the IC, according to the system condition. Furthermore, the high-speed operation might be required. In such a case, the mode will automatically switch to the HS mode at the automatic switching mode (GO mode), when the output current becomes I_{GO} or more. In the HS mode, the response of the output voltage during the output current fluctuation is better than the PS mode. Automatic switching PS mode to HS mode causes the switching delay time of tens of μ s, the output voltage drops more than in the fixed HS mode. If the GO pin voltage is at high level (tens of μ s (ΔT) before the output current fluctuation occurs) and the IC is used in the HS mode, the output current fluctuation will be suppressed to as low as the fixed HS mode. (cf. the following item: Load Transient Response by Switching Mode with GO pin.)

The output current at the HS/PS mode should be adjusted to 2.0mA or more / 0.3mA or less respectively when the IC is used in the HS/PS automatic switching mode (GO mode).

It is suggested that you use this IC with either a V_{IN} voltage or a V_{SS} voltage input at the GO pin. If this IC is used with the correct specifications for the GO pin, the IC will operate normally. However, supply current may increase as a result of through current in the IC's internal circuitry when medium voltage is input.

■ OPERATIONAL EXPLANATION (Continued)

<Green Operation> (Continued)

● Load Transient Response by GO mode

- GO mode (GO pin voltage: Low)

Output Current: $I_{OUT}=0.1\text{mA}$ 100mA

- Fixed high speed mode via GO pin signal (GO pin voltage: Low to High)

Output Current: $I_{OUT}=0.1\text{mA}$ 100mA

*Note: Input a "H" level signal to the GO pin before the output current fluctuation (ΔT) occurs.

- GO mode (GO pin voltage: Low)

Output Current: $I_{OUT}=0.1\text{mA}$ 5mA

- Fixed high speed mode via GO pin signal (GO pin voltage: Low to High)

Output Current: $I_{OUT}=0.1\text{mA}$ 5mA

<Low ESR capacitor>

With the XC6207 series, a stable output voltage is achievable even if used with low ESR capacitors, as a phase compensation circuit is built-in. In order to ensure the effectiveness of the phase compensation, we suggest that an output capacitor (C_L) is connected as close as possible to the output pin (V_{OUT}) and the V_{SS} pin. Please use an output capacitor with a capacitance value of at least $1\mu\text{F}$ when the setting output voltage ($V_{OUT(T)}$) is less than or equal to 1.8V . Also, when the setting output voltage ($V_{OUT(T)}$) is less than or equal to 2.5V , please connect an input capacitor (C_{IN}) of $2.2\mu\text{F}$ between the V_{IN} pin and the V_{SS} pin in order to ensure a stable power input. The capacitor is possible to decrease depends on bias and temperature. Therefore the phase compensation cannot be ensured effectiveness. Stable phase compensation may not be ensured if the capacitor runs out capacitance when depending on bias and temperature. In case the capacitor depends on the bias and temperature, please make sure the capacitor can ensure the actual capacitance.

<Recommended conditions of C_{IN} and C_L >

SETTING VOLTAGE	C_{IN} (μF)	C_L (μF)
More than 1.2V ~ Under 1.8V	1.0	4.7
More than 1.8V ~ Under 2.5V	1.0	1.0
More than 2.5V ~ Less than 5.0V	2.2	1.0

■ OPERATIONAL EXPLANATION (Continued)

<CL Auto-Discharge Function>

XC6207B series can quickly discharge the electric charge at the output capacitor (CL), when a low signal to the CE pin, which enables a whole IC circuit put into OFF state, is inputted via the N-channel transistor located between the VOUT pin and the VSS pin (cf. BLOCK DIAGRAM). In this state, the application is protected from a glitch operation caused by the electric charge at the output capacitor (CL). The CL auto-discharge resistance at this time depends on the input voltage. Moreover, discharge time of the output capacitor (CL) is set by the CL auto-discharge resistance (R) and the output capacitor (CL). By setting time constant of a CL auto-discharge resistance value [R] and an output capacitor value (CL) as τ ($\tau = C \times R$), the output voltage after discharge via the N channel transistor is calculated by the following formulas.

$$V = V_{OUT} \times e^{-t/\tau}, \text{ or } t = \tau \ln (V_{OUT} / V)$$

(V : Output voltage after discharge, $V_{OUT(E)}$: Output voltage, t: Discharge time,
 τ : CL auto-discharge resistance R × Output capacitor (CL) value C)

Ta=25°C

INPUT VOLTAGE	CL AUTO-DISCHARGE RESISTANCE
2.0V	750Ω (TYP.)
3.0V	550Ω (TYP.)
4.0V	500Ω (TYP.)
5.0V	480Ω (TYP.)
6.0V	470Ω (TYP.)

(ex.) When input voltage: 4.0V, CL auto-discharge resistance: 500Ω (TYP.); output capacitor (CL): 10 μ F, V_{OUT} :3.0V,
 CE voltage=Changing from 4.0V to 0V (The CE pin L level signal)

- 1 τ (500 μ s) after CE OFF signal is inputted, $V_{OUT(E)}$ becomes: $3.0V \times 0.368 = \text{approx. } 1.104V$
- 2 τ (1000 μ s) after CE OFF signal is inputted, $V_{OUT(E)}$ becomes: $3.0V \times 0.135 = \text{approx. } 0.405V$
- 3 τ (1500 μ s) after CE OFF signal is inputted, $V_{OUT(E)}$ becomes: $3.0V \times 0.050 = \text{approx. } 0.150V$
- 4 τ (2000 μ s) after CE OFF signal is inputted, $V_{OUT(E)}$ becomes: $3.0V \times 0.018 = \text{approx. } 0.055V$

OUTPUT VOLTAGE DISCHARGE CHARACTERISTICS

■ OPERATIONAL EXPLANATION (Continued)

<Current Limiter, Short-Circuit Protection>

The XC6207 series includes a combination of a fixed current limiter circuit & a foldback circuit, which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates and output voltage drops further and output current decreases. When the output pin is shorted, a current of about 50mA flows.

<The CE Pin>

The IC's internal circuitry can be shutdown via the signal from the CE pin with the XC6207 series. In shutdown mode, output at the V_{OUT} pin will be pulled down to the V_{SS} level via R1 & R2. However, as for the XC6207B series, the C_L auto-discharge resistor is connected in parallel to R1 and R2 while the power supply is applied to the V_{IN} pin. Therefore, time until the V_{OUT} pin reaches the V_{SS} level becomes short. We suggest that you use this IC with either a V_{IN} voltage or a V_{SS} voltage input at the CE pin. If this IC is used with the correct specifications for the CE pin, the IC will operate normally. However, supply current may increase as a result of through current in the IC's internal circuitry when medium voltage is input.

■ NOTES ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please strengthen V_{IN} and V_{SS} wiring in particular.
3. Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as close to the IC as possible.

■ TEST CIRCUITS

Circuit 1 Output Voltage, Input Operating Voltage, Dropout Voltage, Line Regulation, Load Regulation, Limit Current, Short Current

Circuit 2 Supply Current, Standby Current

Circuit 3 Ripple Rejection Rate

Circuit 4 CE/GO, High & Low Level Voltage

Circuit 5 CE/GO, High & Low Level Current

Circuit 6 HS/PS Switching Current, PS Switching Delay Time

Circuit 7 CL Auto-Discharge Resistance Current

Note: For the capacity of the CIN and the CL, the recommended capacity depending on the setting voltage should be used.
