

## Description

The GM7230 series of regulators provide all the active functions for a step-down (buck) switching regulator, and drive 3A load with excellent line and load regulation. GM7230's are available in fixed output voltages of 3.3V, 5V, 12V, and a versatile Adjustable output version.

These regulators are simple to use and require a minimum number of external components. Features include internal frequency compensation and a fixed-frequency oscillator. The GM7230 series are high-efficiency replacements for popular three-terminal linear regulators, requiring a smaller heatsink or even no heatsink.

The GM7230's perform well with standard inductors from several manufacturers, simplifying the design of switch-mode power supplies. The GM7230 series guarantee  $\pm 4\%$  tolerance on output voltage within specified input voltages and output load conditions, and  $\pm 10\%$  on the oscillator frequency.

External shutdown is included, with 80  $\mu$ A (typical) standby current. The output switch has cycle-by-cycle current limiting, as well as thermal shutdown for full protection under fault conditions.

## Features

- ◆ 3.3V, 5V, 12V and Adjustable output versions
- ◆ Adjustable version output voltage range 1.23V to 37V  $\pm 4\%$  max over line and load conditions
- ◆ 3A output current
- ◆ Input voltage range up to 40V
- ◆ Requires only 4 external components
- ◆ High efficiency
- ◆ TTL shutdown capability, low power standby mode
- ◆ Thermal shutdown, current limit protection
- ◆ Uses standard inductors
- ◆ 150 kHz fixed frequency internal oscillator

## Application

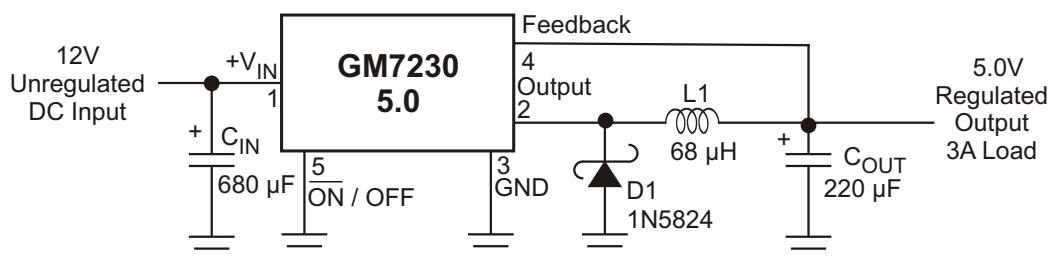

Pre-regulator for linear regulators

High-efficiency step-down buck regulator

On-card/board switching regulators

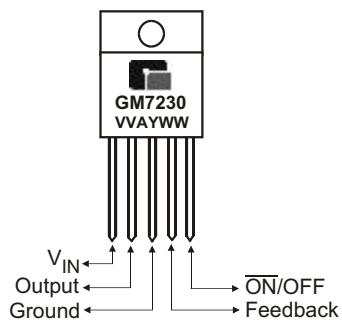

Positive to negative converter (buck-boost)

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics.

**Note 2:** The human body model is a 100 pF capacitor discharged through a 1.5k resistor into each pin.

**Note 3:** Typical numbers are at  $25^\circ\text{C}$  and represent the most likely norm.

**Note 4:** All limits guaranteed at room temperature (standard type face) and at temperature extremes (bold type face). All room temperature limits are 100% production tested. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).

**Note 5:** External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator system performance. When the GM7230 is used as shown in the Figure 1 test circuit, system performance will be as shown in system parameters section of Electrical Characteristics.

**Note 6:** The switching frequency is reduced when the second stage current limit is activated.

**Note 7:** No diode, inductor or capacitor connected to output pin.

**Note 8:** Feedback pin removed from output and connected to 0V to force the output transistor switch ON.

**Note 9:** Feedback pin removed from output and connected to 12V for the 3.3V, 5V, and the ADJ. version, and 15V for the 12V version, to force the output transistor switch OFF.

**Note 10:**  $V_{IN} = 40\text{V}$ .

**Note 11:** Junction to ambient thermal resistance (no external heat sink) for the TO-220 package mounted vertically, with the leads soldered to a printed circuit board with (1 oz.) copper area of approximately 1 in<sup>2</sup>.

**Note 12:** Junction to ambient thermal resistance with the TO-263 package tab soldered to a single printed circuit board with 0.5 in<sup>2</sup> of (1 oz.) copper area.

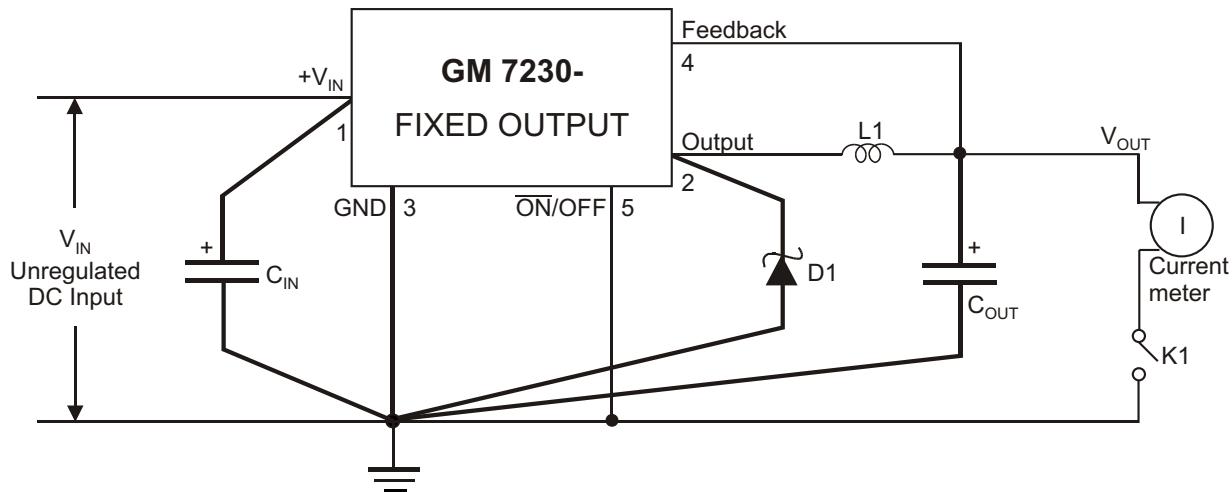

**Note 13:** Junction to ambient thermal resistance with the TO-263 package tab soldered to a single sided printed circuit board with 2.5 in<sup>2</sup> of (1 oz.) copper area.

**Note 14:** Junction to ambient thermal resistance with the TO-263 package tab soldered to a double sided printed circuit board with 3 in<sup>2</sup> of (1 oz.) copper area on the GM7230 side of the board, and approximately 16 in<sup>2</sup> of copper on the other side of the p-c board.

## ◆ TEST CIRCUIT AND LAYOUT GUIDELINES

Careful layout is important with any switching regulator. Rapidly switching currents associated with wiring inductance generate voltage transients which can cause problems. To minimize inductance and ground loops, the lengths of the leads indicated by heavy lines in Figure 1 below should be kept as short as possible. Single-point grounding (as indicated in Figure 1) or ground plane construction should be used for best results. When using the Adjustable version, place the programming resistors as close as possible to the GM7230, to keep the sensitive feedback wiring short.
