DS15EA101
0.15 to 1.5 Gbps Adaptive Cable Equalizer with LOS Detection

General Description

The DS15EA101 is an adaptive equalizer optimized for equalizing data transmitted over copper cables. The DS15EA101 operates over a wide range of data rates from 150 Mbps to 1.5+ Gbps and automatically adapts to equalize any cable length from zero meters to lengths that attenuate the signal by 35 dB at 750 MHz.

The DS15EA101 allows either single-ended or differential input drive. This enables equalization of coaxial cables as well as differential twin-ax and twisted pair cables.

Additional features include an LOS output and an output enable which, when tied together, disable the output when no signal is present.

The DS15EA101 is powered from a single 3.3V supply and consumes 210 mW at 1.5 Gbps. It operates over the full −40°C to +85°C industrial temperature range and is available in a space saving 4 x 4 mm LLP-16 package which allows for high density placement of components in multi-channel applications.

Features

- Automatic equalization of coaxial, twin-ax and twisted pair cables
- High data rates: 150 Mbps to 1.5+ Gbps
- Up to 35 dB of boost at 750 MHz
- LOS detection and output enable
- Single-ended or differential input
- 50Ω differential outputs
- Low power operation, 210 mW (typ) at 1.5 Gbps
- Industrial -40°C to +85°C temperature
- Space-saving 4 x 4 mm LLP-16 package

Applications

- Cable extention applications
- Security cameras
- Remote LCDs and LED panels
- Data recovery equalization

Note 1: "Absolute Maximum Ratings" are those parameter values beyond which the life and operation of the device cannot be guaranteed. The stating herein of these maximums shall not be construed to imply that the device can or should be operated at or beyond these values. The table of "Electrical Characteristics" specifies acceptable device operating conditions.

Note 2: Current flow into device pins is defined as positive. Current flow out of device pins is defined as negative. All voltages are stated referenced to 0 volts.

Note 3: Typical values are stated for V_{CC} = +3.3V and T_A = +25°C.

Note 4: Specification is guaranteed by characterization.

Note 5: Specification is guaranteed by design.

Note 6: The maximum input voltage amplitude assumes a DC-balanced signal.

Note 7: Supply current depends on the amount of cable being equalized. The current is highest for short cable and decreases as the cable length is increased.

Note 8: The total residual jitter at BER-12 was calculated as DJ+14.1xRJ, where DJ is deterministic jitter and RJ is random jitter. The jitter is expressed as a portion of a unit interval (UI). One UI is a reciprocal of a bit rate (or data rate). For example, a 1.5 Gbps (gigabit per second) signal has 1 / (1.5 Gb/s) = 666.67 ps (picosecond) unit interval. A 0.25 UI jitter is equivalent to 0.25 x 666.67 ps = 166.67 ps.

13	VCC	Power supply pin.
14	$\overline{EN}$	Output enable pin.
15	LOS	Los of signal circuitry output pin.
16	VCC	Power supply pin.

Device Operation

INPUT INTERFACING

The DS15EA101 accepts either differential or single-ended input. The input must be AC coupled. Transformer coupling is not supported. If the signal is differential, its amplitude must be 800 mVp-p ±10% (400 mV single-ended). If the signal is single-ended, its amplitude must be 800 mV ±10%.

OUTPUT INTERFACING

The DS15EA101 uses current mode outputs. They are internally terminated with 50Ω. The following two figures illustrate typical DC-coupled interface to common differential receivers and assume that the receivers have high impedance inputs. While most receivers have an input common mode voltage range that can accomodate CML signals, it is recommended to check respective receiver's datasheet prior to implementing the suggested interface implementations.

CABLE EXTENDER APPLICATION

The DS15EA101 together with the DS15BA101 form a cable extender chipset optimized for extending serial data streams from serializer/deserializer (SerDes) pairs and field programmable gate arrays (FPGAs) over 100Ω differential (i.e. CAT5e/6/7 and twinax) and 50Ω coaxial cables. Setting correct DS15BA101 output amplitude and proper cable termination are keys for optimal operation. The following two figures show recommended chipset configuration for 100Ω differential and 50Ω coaxial cables.
