

NCV4276

Low-Drop Voltage Regulator

This industry standard linear regulator has the capability to drive loads up to 400 mA at 5.0, 3.3, 2.5 and 1.8 V. Package options include DPAK and D²PAK. This device is pin-for-pin compatible with the Infineon part number TLE4276.

Features

- 5.0, 3.3, 2.5 and 1.8 V; $\pm 4\%$; Output Voltage at 400 mA
- 500 mV (max) Dropout Voltage
- Inhibit Input
- Very Low Current Consumption
- Fault Protection
 - ♦ +45 V Peak Transient Voltage
 - ♦ -42 V Reverse Voltage
 - ♦ Short Circuit
 - ♦ Thermal Overload
- NCV Prefix for Automotive and Other Applications Requiring Site and Control Changes

ORDERING INFORMATION

See detailed ordering and shipping information in the ordering information section on page 9 of this data sheet.

PIN FUNCTION DESCRIPTION

Pin No.	Symbol	Description
1	I	Input; Battery Supply Input Voltage.
2	INH	Inhibit; Set low-to inhibit.
3	GND	Ground; Pin 3 internally connected to heatsink.
4	NC	Not Connected for fixed voltage versions.
5	Q	Output; $\pm 4.0\%$, 400 mA output. Use 22 μF , ESR < 2.0 Ω at 10 kHz to ground. See Figure 3.

MAXIMUM RATINGS†

Rating	Min	Max	Unit
Input [I (DC)]	-42	45	V
Input [I (Peak Transient Voltage)]	-	-	V
Inhibit INH	-42	45	V
Output (Q)	-1.0	40	V
Ground (GND)	-	100	mA
Operating Range (I)	Q + 0.5	40	V
ESD Susceptibility (Human Body Model) (Machine Model)	4.0 200	- -	kV V
Junction Temperature	-40	150	°C
Storage Temperature	-50	150	°C
Lead Temperature Soldering	-	240 Peak (Note 3)	°C
Reflow (SMD styles only) Note 1	-	260 Peak	°C
Wave Solder (through hole styles only) Note 2	-		

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

THERMAL CHARACTERISTICS

Parameter	Test Conditions (Typical Value)		Unit
DPAK 5-PIN PACKAGE			
	Min Pad Board (Note 4)	1" Pad Board (Note 5)	
Junction-to-Tab (psi-JLx, ψ_{JLx})	4.2	4.7	C/W
Junction-to-Ambient ($R_{\theta JA}$, θ_{JA})	100.9	46.8	C/W
D ² PAK 5-PIN PACKAGE			
	0.4 sq. in. Spreader Board (Note 6)	1.2 sq. in. Spreader Board (Note 7)	
Junction-to-Tab (psi-JLx, ψ_{JLx})	3.8	4.0	C/W
Junction-to-Ambient ($R_{\theta JA}$, θ_{JA})	74.8	41.6	C/W

- 10 seconds max.
- 60 seconds max above 183°C.
- 5°C/+0°C allowable conditions.
- 1 oz. copper, 0.26 inch² (168 mm²) copper area, 0.62" thick FR4.
- 1 oz. copper, 1.14 inch² (736 mm²) copper area, 0.62" thick FR4.
- 1 oz. copper, 0.373 inch² (241 mm²) copper area, 0.62" thick FR4.
- 1 oz. copper, 1.222 inch² (788 mm²) copper area, 0.62" thick FR4.

† During the voltage range which exceeds the maximum tested voltage of I, operation is assured, but not specified. Wider limits may apply. Thermal dissipation must be observed closely.

Figure 2. Measuring Circuit

TYPICAL PERFORMANCE CHARACTERISTICS

Figure 3. Output Stability with Output Capacitor ESR

Circuit Description

The error amplifier compares a temperature-stable reference voltage to a voltage that is proportional to the output voltage (Q) (generated from a resistor divider) and drives the base of a series transistor via a buffer. Saturation control as a function of the load current prevents any oversaturation of the output power device preventing excessive substrate current (quiescent current).

Calculating Power Dissipation in a Single Output Linear Regulator

The maximum power dissipation for a single output regulator (Figure 4) is:

$$PD(max) = [V_I(max) - V_Q(min)]I_Q(max) + V_I(max)I_q \quad (1)$$

where

- $V_{I(max)}$ is the maximum input voltage,
- $V_{Q(min)}$ is the minimum output voltage,
- $I_{Q(max)}$ is the maximum output current for the application,
- I_q is the quiescent current the regulator consumes at $I_{Q(max)}$.

Once the value of $P_{D(max)}$ is known, the maximum permissible value of $R_{\theta JA}$ can be calculated:

$$R_{\theta JA} = \frac{150^{\circ}\text{C} - T_A}{P_D} \quad (2)$$

The value of $R_{\theta JA}$ can then be compared with those in the package section of the data sheet. Those packages with $R_{\theta JA}$ less than the calculated value in Equation 2 will keep the die temperature below 150°C .

In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heatsink will be required.

Figure 4. Single Output Regulator with Key Performance Parameters Labeled

Heat Sinks

A heat sink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air.

Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of $R_{\theta JA}$:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \quad (3)$$

where

- $R_{\theta JC}$ is the junction-to-case thermal resistance,
- $R_{\theta CS}$ is the case-to-heatsink thermal resistance,
- $R_{\theta SA}$ is the heatsink-to-ambient thermal resistance.

$R_{\theta JC}$ appears in the package section of the data sheet. Like $R_{\theta JA}$, it too is a function of package type. $R_{\theta CS}$ and $R_{\theta SA}$ are functions of the package type, heatsink and the interface between them. These values appear in data sheets of heat sink manufacturers.

Thermal, mounting, and heatsinking considerations are discussed in the ON Semiconductor application note AN1040/D.

NOTE: Bold face items represent the package without the external thermal system.

The Cauer networks generally have physical significance and may be divided between nodes to separate thermal behavior due to one portion of the network from another. The Foster networks, though when sorted by time constant (as above) bear a rough correlation with the Cauer networks, are really only convenient mathematical models. Cauer networks can be easily implemented using circuit simulating tools, whereas Foster networks may be more easily implemented using mathematical tools (for instance, in a spreadsheet program), according to the following formula:

$$R(t) = \sum_{i=1}^n R_i (1 - e^{-t/\tau_i})$$
