ANALOG DEVICES

AC '97 SoundMAX® Codec
AD1981BL

FEATURES
AC '97 2.3 COMPATIBLE FEATURES
S/PDIF Output, 20 Bits Data Format, Supporting
   48 kHz and 44.1 kHz Sample Rates
Integrated Stereo Headphone Amplifier
Variable Sample Rate Audio
External Audio Power-Down Control
Greater than 90 dB Dynamic Range
Stereo Full-Duplex Codec
20-Bit PCM DAC
3 Analog Line-Level Stereo Inputs for
   Line-In, AUX, and CD
Mono Line-Level Phone Input
Dual MIC Input with Built-In Programmable Preamp
High Quality CD Input with Ground Sense

Mono Output for Speakerphone or Internal Speaker
   Power Management Support
48-Lead LQFP Package, Lead-Free Package Available

ENHANCED FEATURES
Stereo MIC Preamps Support
Built-In Digital Equalizer Function for Optimized
   Speaker Sound
Full-Duplex Variable Sample Rates from 7040 Hz to
   48 kHz with 1 Hz Resolution
Jack Sense Pins Provide Automatic Output Switching
Software Programmed V_{REFOUT} Output for Biasing
   Microphone and External Power Amp
Low Power 3.3 V Operation for Analog and
   Digital Supplies
Multiple Codec Configuration Options

  Analog Input Voltage . . . . –0.3 V to AV_{DD} + 0.3 V
Ambient Temperature Range (Operating) . . . . . . 0°C to 70°C

*Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

NOTES
[1]ST = Low Profile Quad Flatpack.
[2]The AD1981BLJSTZ is a lead-free environmentally friendly product. It is manufactured using the most up-to-date materials and processes. The coating on the leads of each device is 100% pure tin electroplate. The device is suitable for lead-free applications and is able to withstand surface-mount soldering at up to 255 °C (±5°C). In addition, it is backward compatible with conventional tin-lead soldering processes. This means that the electroplated tin coating can be soldered with tin-lead solder pastes at reflow temperatures of 220°C to 235°C.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD1981BL features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

WARNING!

NOTES

All registers not shown. Bits containing an X are assumed to be reserved.

Odd register addresses are aliased to the next lower even address.

Reserved registers should not be written.

Zeros should be written to reserved bits.

*For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 76h. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, RM bit has no effect.

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
00h	Reset	X	SE4	SE3	SE2	SE1	SE0	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0	0090h

NOTES

X in the above table is a wild card and has no effect on the value.

Writing any value to this register performs a register reset that causes all registers to revert to their default values (except 74h, which forces the serial configuration).

Reading this register returns the ID code of the part and a code for the type of 3D stereo enhancement.

ID[9:0] Identify Capability. The ID decodes the capabilities of AD1981BL based on the following:

Bit	Function	AD1981BL
ID0	Dedicated Mic PCM In Channel	0
ID1	Modem Line Codec Support	0
ID2	Bass and Treble Control	0
ID3	Simulated Stereo (Mono to Stereo)	0
ID4	Headphone Out Support	1
ID5	Loudness (Bass Boost) Support	0
ID6	18-Bit DAC Resolution	0
ID7	20-Bit DAC Resolution	1
ID8	18-Bit ADC Resolution	0
ID9	20-Bit ADC Resolution	0

SE[4:0] Stereo Enhancement. The AD1981BL does not provide hardware 3D stereo enhancement (all bits are zeros).

Master Volume Register (Index 02h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
02h	Master Volume	MM	X	X	LMV4	LMV3	LMV2	LMV1	LMV0	RM*	X	X	RMV4	RMV3	RMV2	RMV1	RMV0	8000h

* For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 76h. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, RM bit has no effect. All registers not shown and bits containing an X are assumed to be reserved.

Refer to Table I for examples. This register controls the Line_Out volume controls for both stereo channels and the mute bit. Each volume subregister contains five bits, generating 32 volume levels with 31 steps of 1.5 dB each. Because AC '97 defines 6-bit volume registers, to maintain compatibility whenever the D5 or D13 bits are set to 1, their respective lower five volume bits are automatically set to 1 by the codec logic. On readback, all lower five bits will read 1s whenever these bits are set to 1.

RMV[4:0]	Right Master Volume Control. The least significant bit represents 1.5 dB. This register controls the output from 0 dB to a maximum attenuation of 46.5 dB.
RM	Right Channel Mute. Once enabled by the MSPLT bit in Register 76h, this bit mutes the right channel separately from the MM bit. Otherwise, this bit will always read 0 and will have no effect when set to 1.
LMV[4:0]	Left Master Volume Control. The least significant bit represents 1.5 dB. This register controls the output from 0 dB to a maximum attenuation of 46.5 dB.
MM	Master Volume Mute. When this bit is set to 1, both the left and right channels are muted, unless the MSPLT bit in Register 76h is set to 1, in which case this mute bit will affect only the left channel.

Headphones Volume Register (Index 04h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default

*For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 76h. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, RM bit has no effect. All registers not shown, and bits containing an X are assumed to be reserved.

Refer to Table I for examples. This register controls the headphone volume controls for both stereo channels and mute bit. Each volume subregister contains five bits, generating 32 volume levels with 31 steps of 1.5 dB each. Because AC '97 defines 6-bit volume registers, to maintain compatibility, whenever the D5 or D13 bits are set to 1, their respective lower five volume bits are automatically set to 1 by the codec logic. On readback, all lower five bits will read 1s whenever these bits are set to 1.

RHV [4:0]	Right Headphone Volume Control. The least significant bit represents 1.5 dB. This register controls the output from 0 dB to a maximum attenuation of 46.5 dB.
RM	Right Channel Mute. Once enabled by the MSPLT bit in Register 76h, this bit mutes the right channel separately from the HPM bit. Otherwise, this bit will always read 0 and will have no effect when set to 1.
LHV [4:0]	Left Headphone Volume Control. The least significant bit represents 1.5 dB. This register controls the output from 0 dB to a maximum attenuation of 46.5 dB.
HPM	Headphones Volume Mute. When this bit is set to 1, both the left and right channels are muted, unless the MSPLT bit in Register 76h is set to 1, in which case this mute bit will affect only the left channel.

MCV[4:0]	MIC Volume Gain. Allows setting the phone volume attenuator in 32 volume levels with 31 steps of 1.5 dB each. The LSB represents 1.5 dB, and the gain range is +12 dB to −34.5 dB. The default value is 0 dB, with the mute bit enabled.
M20	MIC Gain Boost. This bit allows setting additional MIC gain to increase the microphone sensitivity. The nominal gain boost by default is 20 dB; however, Bits D0 and D1 (MBG[1:0]) on the miscellaneous control bits register (76h) allow changing the gain boost to 10 dB or 30 dB if necessary. 0 = Disabled; Gain = 0 dB 1 = Enabled; Default Gain = 20 dB (see Register 76h, Bits D0, D1)
MCM	MIC Mute. When this bit is set to 1, the MIC channel is muted.

If MSPLT is not set, the RM bit has no effect. All registers not shown, and bits containing an X are assumed to be reserved. Refer to Table IV for examples.

RLV[4:0]	Line-In Volume Right. Allows setting the line-in right channel attenuator in 32 volume levels. The LSB represents 1.5 dB, and the range is +12 dB to –34.5 dB. The default value is 0 dB, mute enabled.
RM	Right Channel Mute. Once enabled by the MSPLT bit in Register 76h, this bit mutes the right channel separately from the LM bit. Otherwise, this bit will always read 0 and will have no effect when set to 1.
LLV[4:0]	Line-In Volume Left. Allows setting the line in left channel attenuator in 32 volume levels. The LSB represents 1.5 dB, and the range is +12 dB to –34.5 dB. The default value is 0 dB, mute enabled.
LVM	Line-In Mute. When this bit is set to 1, both the left and right channels are muted unless the MSPLT bit in Register 76h is set to 1, in which case this mute bit will affect only the left channel.

This register should be read before writing to generate a mask for only the bit(s) that need to be changed. All registers not shown and bits containing an X are assumed to be reserved.

LPBK	Loopback Control. ADC/DAC Digital Loopback Mode. 0 = No Loopback (Default). 1 = Loopback PCM Digital Data from ADC Output to DAC.
MS	MIC Select. Selects mono MIC input. 0 = Select MIC1. 1 = Select MIC2. See 2CMIC bit in Register 76h to enable stereo microphone recording.
MIX	Mono Output Select. Selects mono output audio source. 0 = Mixer mono output (reset default). 1 = MIC1 channel.

Power-Down Control/Status Register (Index 26h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
26h	Power-Down Ctrl/Stat	EAPD	PR6	PR5	PR4	PR3	PR2	PR1	PR0	X	X	X	X	REF	ANL	DAC	ADC	000Xh

The ready bits are read-only; writing to REF, ANL, DAC, ADC will have no effect. These bits indicate the status for the AD1981BL subsections. If the bit is a 1, that subsection is *ready*. *Ready* is defined as the subsection able to perform in its nominal state. All registers not shown, and bits containing an X are assumed to be reserved.

ADC	ADC Sections Ready to Transmit Data.
DAC	DAC Sections Ready to Accept Data.
ANL	Analog Amplifiers, Attenuators, and Mixers Ready.
REF	Voltage References, V_{REF} and V_{REFOUT} up to Nominal Level.
PR [6:0]	Codec Power-Down Modes. The first three bits are to be used individually rather than in combination with each other. PR3 can be used in combination with PR2 or by itself. The mixer and reference cannot be powered down via PR3 unless the ADCs and DACs are also powered down.
	Nothing else can be powered up until the reference is up. PR5 has no effect unless all ADCs, DACs, and the ac-link are powered down. The reference and the mixer can be either up or down, but all power-up sequences must be allowed to run to completion before PR5 and PR4 are both set.
	In multiple codec systems, the master codec's PR5 and PR4 bits control the slave codec. PR5 is also effective in the slave codec if the master's PR5 bit is clear, but the PR4 bit has no effect except to enable or disable PR5.
EAPD	External Audio Power-Down Control. Controls the state of the EAPD pin. EAPD = 0 sets the EAPD pin low, enabling an external power amplifier (reset default). EAPD = 1 sets the EAPD pin high, shutting the external power amplifier off.

AD1981BL

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
28h	Ext'd Audio ID	IDC1	IDC0	X	X	REVC1	REVC0	AMAP	X	X	X	DSA1	DSA0	X	SPDIF	X	VRAS	X605h

The Extended Audio ID register identifies which extended audio features are supported. A nonzero Extended Audio ID value indicates that one or more of the extended audio features are supported. All registers not shown, and bits containing an X are assumed to be reserved.

VRAS	Variable Rate PCM Audio Support (Read-Only). This bit returns a 1 when Read To indicates that the variable rate PCM audio is supported.
SPDIF	SPDIF Support (Read-Only). This bit returns a 1 when Read To indicates that the SPDIF transmitter is supported (IEC958). This bit is also used to validate that the SPDIF transmitter output is actually enabled. The SPDIF bit is allowed to be set high only if the SPDIF pin (48) is pulled down at power-up, enabling the codec transmitter logic. If the SPDIF pin is floating or pulled high at power-up, the transmitter logic is disabled; therefore, this bit returns a low, indicating that the SPDIF transmitter is not available. This bit must always be read back to verify that the SPDIF transmitter is actually enabled.
DSA[1,0]	DAC Slot Assignments (Read/Write) (Reset Default = 00). 00 DACs 1, 2 = 3 and 4. 01 DACs 1, 2 = 7 and 8. 10 DACs 1, 2 = 6 and 9. 11 Reserved.
AMAP	Slot DAC Mappings Based on Codec ID (Read-Only). This bit returns a 1 when read to indicate that slot/DAC mappings based on the codec ID are supported.
REVC[1,0]	REVC[1,0] = 01 indicates codec is AC '97 revision 2.2 compliant (Read-Only).
IDC[1:0]	Indicates Codec Configuration (Read-Only). 00 = Primary. 01, 10, 11 = Secondary.

Extended Audio Status and Control Register (Index 2Ah)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
2Ah	Ext'd Audio Stat/Ctrl	VFORCE	X	X	X	X	SPCV	X	X	X	X	SPSA1	SPSA0	X	SPDIF	X	VRA	0000h

All registers not shown and bits containing an X are assumed to be reserved. The Extended Audio Status and Control register is a read/write register that provides status and control of the extended audio features.

VRA	Variable Rate Audio (Read/Write). VRA = 0 sets fixed sample rate audio at 48 kHz (reset default). VRA = 1 enables variable rate audio mode (enables sample rate registers and SLOTREQ signaling).
SPDIF	SPDIF Transmitter Subsystem Enable/Disable Bit (Read/Write). SPDIF = 1 enables the SPDIF transmitter. SPDIF = 0 disables the SPDIF transmitter (default). This bit is also used to validate that the SPDIF transmitter output is actually enabled. The SPDIF bit is allowed to be set high only if the SPDIF pin (48) is pulled down at power-up, enabling the codec transmitter logic. If the SPDIF pin is floating or pulled high at power-up, the transmitter logic is disabled and this bit therefore returns a low, indicating that the SPDIF transmitter is not available. This bit must always be read back to verify that the SPDIF transmitter is actually enabled.
SPSA[1:0]	SPDIF Slot Assignment Bits (Read/Write). These bits control the SPDIF slot assignment and respective defaults, depending on the codec ID configuration.
SPCV	SPDIF Configuration Valid (Read-Only). Indicates the status of the SPDIF transmitter subsystem, enabling the driver to determine if the currently programmed SPDIF configuration is supported. SPCV is always valid, independent of the SPDIF enable bit status. SPCV = 0 indicates current SPDIF configuration (SPSA, SPSR, DAC slot rate, DRS) is not valid (not supported). SPCV = 1 indicates current SPDIF configuration (SPSA, SPSR, DAC slot rate, DRS) is valid (is supported).
VFORCE	Validity Force Bit (Reset Default = 0). When asserted, this bit forces the SPDIF stream Validity flag (Bit 28 within each SPDIF L/R subframe) to be controlled by the V bit (D15) in Register 3Ah (SPDIF control register). VFORCE = 0 and V = 0; the Validity bit is managed by the codec error detection logic. VFORCE = 0 and V = 1; the Validity bit is forced high, indicating subframe data is invalid. VFORCE = 1 and V = 0; the Validity bit is forced low, indicating subframe data is valid. VFORCE = 1 and V = 1; the Validity bit is forced high, indicating subframe data is invalid.

This read/write sample rate control register contains a 16-bit unsigned value, representing the rate of operation in Hz.

SRF[15:0]	Sample Rate. The sampling frequency range is from 7 kHz (1B58h) to 48 kHz (BB80h) in 1 Hz increments. If 0 is written to VRA, the sample rate is reset to 48 kHz.

SRA[15:0]	Sample Rate. The sampling frequency range is from 7 kHz (1B58h) to 48 kHz (BB80h) in 1 Hz increments. If 0 is written to VRA, the sample rate is reset to 48 kHz.

SPDIF Control Register (Index 3Ah)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
3Ah	SPDIF Control	V	X	SPSR1	SPSR0	L	CC6	CC5	CC4	CC3	CC2	CC1	CC0	PRE	COPY	$\overline{\text{AUD}}$	PRO	2000h

Register 3Ah is a read/write register that controls SPDIF functionality and manages bit fields propagated as channel status (or subframe in the V case). With the exception of V, this register should be written to only when the SPDIF transmitter is disabled (SPDIF bit in Register 2Ah is 0). This ensures that control and status information start up correctly at the beginning of SPDIF transmission.

PRO	Professional. 1 indicates professional use of channel status. 0 indicates consumer.
$\overline{\text{AUD}}$	Non-Audio. 1 indicates data is non-PCM format. 0 data is PCM.
COPY	Copyright. 1 indicates copyright is asserted. 0 copyright is not asserted.
PRE	Pre-Emphasis. 1 indicates filter pre-emphasis is 50 μs/15 μs. 0 pre-emphasis is none.
CC[6:0]	Category Code. Programmed according to IEC standards, or as appropriate.
L	Generation Level. Programmed according to IEC standards, or as appropriate.
SPSR[1:0]	SPDIF Transmit Sample Rate. SPSR[1:0] = 00 Transmit sample rate = 44.1 kHz. SPSR[1:0] = 01 Reserved. SPSR[1:0] = 10 Transmit sample rate = 48 kHz (reset default). SPSR[1:0] = 11 Not supported.
V	Validity. This bit affects the validity flag (Bit 28 transmitted in each SPDIF L/R subframe) and enables the SPDIF transmitter to maintain connection during error or mute conditions. V = 1 Each SPDIF subframe (L + R) has Bit 28 set to 1. This tags both samples as invalid. V = 0 Each SPDIF subframe (L + R) has Bit 28 set to 0 for valid data and 1 for invalid data (error condition). Note that when V = 0, asserting the VFORCE bit (D15) in Register 2Ah (Ext'd Audio Stat/Ctrl) will force the Validity flag low, marking both samples as valid.

EQ Control Register (Index 60h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
60h	EQ CTRL	EQM	MAD LBEN	X	X	X	X	X	X	SYM	CHS	BCA5	BCA4	BCA3	BCA2	BCA1	BCA0	8080h

Register 60h is a read/write register that controls the equalizer functionality and data setup. This register also contains the Biquad and Coefficient Address pointer, which is used in conjunction with the EQ Data Register (78h) to set up the equalizer coefficients. The reset default disables the equalizer function until the coefficients can be properly set up by the software and sets the Symmetry bit to allow equal coefficients for left and right channels. All registers not shown and bits containing an X are assumed to be reserved.

CHS	Channel Select. CHS = 0 selects left channel coefficients data block. CHS = 1 selects right channel coefficients data block.
SYM	Symmetry. When set to 1, this bit indicates that the left and right channel coefficients are equal. This shortens the coefficients' setup sequence since only the left channel coefficients need to be addressed and set up (the right channel coefficients are fetched from the left channel memory).
MAD LBEN	Mixer ADC Loopback Enable. Enables mixer ADC data to be summed into PCM stream. 0 = No loopback allowed (default). 1 = Enable loopback.
EQM	Equalizer Mute. When set to 1, this bit disables the equalizer function (allows all data to pass through). The reset default sets this bit to 1, disabling the equalizer function until the biquad coefficients can be properly set.

EQ Data Register (Index 62h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default

This read/write register is used to transfer EQ biquad coefficients into memory. The register data is transferred to, or retrieved from, the address pointed to by the BCA bits in the EQ CNTRL Register (60h). Data will be written to memory only if the EQM bit (Register 60h, Bit 15) is asserted.

CFD[15:0]	Coefficient Data. The biquad coefficients are fixed point format values with 16 bits of resolution. The CFD15 bit is the MSB, and the CFD0 bit is the LSB.

Mixer ADC, Input Gain Register (Index 64h)

*For AC '97 compatibility, Bit D7 (RM) is available only by setting the MSPLT bit, Register 76h. The MSPLT bit enables separate mute bits for the left and right channels. If MSPLT is not set, the RM bit has no effect. All registers not shown and bits containing an X are assumed to be reserved. Refer to Table VII for examples.

RMG[3:0]	Right Mixer Gain Control. This register controls the gain into the mixer ADC from 0 dB to a maximum gain of 22.5 dB. The least significant bit represents 1.5 dB.
RM	Right Channel Mute. Once enabled by the MSPLT bit in Register 76h, this bit mutes the right channel separately from the MXM bit. Otherwise, this bit will always read 0 and will have no affect when set to 1.
LMG[3:0]	Left Mixer Gain Control. This register controls the gain into the mixer ADC, from 0 dB to a maximum gain of 22.5 dB. The least significant bit represents 1.5 dB.
MXM	Mixer Gain Register Mute. 0 = Unmuted. 1 = Muted (reset default).

All register bits are read/write except for JS0ST and JS1ST, which are read-only. All registers not shown and bits containing an X are assumed to be reserved.

JS0INT	Indicates Pin JS0 Has Generated an Interrupt. Remains set until the software services JS0 interrupt, i.e., JS0 ISR should clear this bit by writing a 0 to it. Note that the interrupt to the system is actually an OR combination of this bit and JS1INT. Also note that the actual interrupt implementation is selected by the INTS bit (Register 76h). It is also possible to generate a software system interrupt by writing a 1 to this bit.
JS1INT	Indicates Pin JS1 Has Generated an Interrupt. Remains set until the software services JS1 interrupt, i.e., JS1 ISR should clear this bit by writing a 0 to it. See JS0INT description for additional details.
JS0ST	JS0 State. This bit always reports the logic state of JS0 pin.
JS1ST	JS1 State. This bit always reports the logic state of JS1 pin.
JS0MD	JS0 Mode. This bit selects the operation mode for the JS0 pin. 0 = Jack Sense mode (default). 1 = Interrupt mode.
JS1MD	JS1 Mode. This bit selects the operation mode for the JS1 pin. 0 = Jack Sense mode (default). 1 = Interrupt mode.
JS0TMR	JS0 Timer Enable. If this bit is set to a 1, JS0 must be high for greater than 278 ms to be recognized.
JS1TMR	JS1 Timer Enable. If this bit is set to a 1, JS1 must be high for greater than 278 ms to be recognized.
JS0EQB	JS0 EQ Bypass Enable. This bit enables JS0 to control the EQ bypass. When this bit is set to 1, JS0 = 1 will cause the EQ to be bypassed.
JS1EQB	JS1 EQ Bypass Enable. This bit enables JS1 to control the EQ bypass. When this bit is set to 1, JS1 = 1 will cause the EQ to be bypassed.
JSMT[2,0]	JS Mute Enable Selector. These three bits select and enable the Jack Sense muting action (see Table VIII).

FMUTE = Output is forced to mute independent of the respective volume register setting.
ACTIVE = Output is not muted and its status is dependent on the respective volume register setting.
OUT = Nothing plugged into the jack and therefore the JS status is low (via the load resistor pull-down).
IN = Jack has plug inserted and therefore the JS status is high (via the codec JS internal pull-up).

Serial Configuration Register (Index 74h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
74h	Serial Config-uration	SLOT16	REGM2	REGM1	REGM0	X	X	X	CHEN	X	X	X	INTS	X	SPAL	SPDZ	SPLNK	7001h

This register is not reset when the reset register (Register 00h) is written. All registers not shown and bits containing an X are assumed to be reserved.

SPLNK	SPDIF Link. This bit enables the SPDIF to link with the DAC for data requesting. 0 = SPDIF and DAC are not linked. 1 = SPDIF and DAC are linked and receive the same data requests (reset default).
SPDZ	SPDIF DACZ. 0 = Repeat last sample out of the SPDIF stream if FIFO underruns (reset default). 1 = Forces midscale sample out the SPDIF stream if FIFO underruns.
SPAL	SPDIF ADC Loop-Around. 0 = SPDIF transmitter is connected to the ac-link stream (reset default). 1 = SPDIF transmitter is connected to the digital ADC stream, not the ac-link.
INTS	Interrupt Mode Select. This bit selects the JS interrupt implementation path. 0 = Bit 0 SLOT 12 (modem interrupt). 1 = Slot 6 valid bit (MIC ADC interrupt).
CHEN	Chain Enable. This bit enables chaining of a slave codec SDATA_IN stream into the ID0 pin (Pin 45). 0 = Disable chaining (reset default). 1 = Enable chaining into ID0 pin.
REGM0	Master Codec Register Mask.
REGM1	Slave 1 Codec Register Mask.
REGM2	Slave 2 Codec Register Mask.
SLOT16	Enable 16-Bit Slot Mode. SLOT16 makes all ac-link slots 16 bits in length, formatted into 16 slots. This is a preferred mode for DSP serial port interfacing.

Miscellaneous Control Bit Register (Index 76h)

Reg No.	Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
76th	Misc Control Bits	DACZ	X	MSPLT	LODIS	DAM	X	FMXE	X	MADPD	2CMIC	X	MADST	VREFH	VREFD	MBG1	MBG0	0000h

All registers not shown and bits containing an X are assumed to be reserved.

MBG[1:0]	MIC Boost Gain Change Register. These two bits allow changing the MIC preamp gain from the nominal 20 dB gain. Note: This gain setting takes affect only while Bit D6 (M20) on the MIC volume register (0Eh) is set to 1; otherwise, the MIC boost block has a gain of 0 dB. 00 = 20 dB gain (reset default). 01 = 10 dB gain. 10 = 30 dB gain. 11 = Reserved.
VREFD	V_{REFOUT} Disable. Disables V_{REFOUT}, placing it into High Z Out mode. Note that this bit overrides the VREFH bit selection (see below). 0 = V_{REFOUT} pin is driven by the internal reference (reset default). 1 = V_{REFOUT} pin is placed into High Z Out mode.
VREFH	V_{REFOUT} High. Changes V_{REFOUT} from 2.25 V to 3.70 V for MIC bias applications. 0 = V_{REFOUT} pin is set to 2.25 V output (reset default). 1 = V_{REFOUT} pin is set to 2.25 V output.

REV. 0

MADST	Mixer ADC Status Bit. Indicates status of mixer digitizing ADC (left and right channels). 0 = Mixer ADC not ready. 1 = Mixer ADC ready.
MADPD	Mixer ADC Power-Down. Controls power down for mixer digitizing ADC. 0 = Mixer ADC is powered on (default). 1 = Mixer ADC is powered down.
2CMIC	2-Channel MIC Select. This bit enables simultaneous recording from MIC1 and MIC2 inputs for applications that use a stereo microphone array. Note that this register works in conjunction with the MS bit in Register 20h. 0 = MIC1 or MIC2 (determined by MS bit) is routed to the record selector's left and right MIC channels as well as to the mixer (reset default). 1 = MIC1 is routed to the record selector's left MIC channel and MIC2 is routed to the record selector's right MIC channel. Note that in this mode, the MS bit should be set low and MIC1 can still be enabled into the mixer.
FMXE	Front DAC into Mixer Enable. Controls the front (main) DAC to mixer mute switches. 0 = Front DAC outputs are allowed to sum into the mixer (reset default). 1 = Front DAC outputs are muted into the mixer (blocked).
DAM	Digital Audio Mode. PCM DAC outputs bypass the analog mixer and are sent directly to the codec output.
LODIS	LINE_OUT Disable. Disables the LINE_OUT pins (L/R), placing them into High Z mode so that the assigned output audio jack can be shared for input function (or other function). 0 = LINE_OUT pins have normal audio drive capability (reset default). 1 = LINE_OUT pins are placed into High Z mode.
MSPLT	Mute Split. Allows separate mute control bits for Master, Headphone, LINE_IN, CD, AUX, and PCM volume control registers as well as record gain register. 0 = Both left and right channel mutes are controlled by Bit 15 in the respective registers (reset default). 1 = Bit 15 affects only the left channel mute and Bit 7 affects only the right channel mute.
DACZ	DAC Zero-Fill. Determines DAC data fill under starved conditions. 0 = DAC data is repeated when DACs are starved for data (reset default). 1 = DAC is zero-filled when DACs are starved for data.
