DESCRIPTION

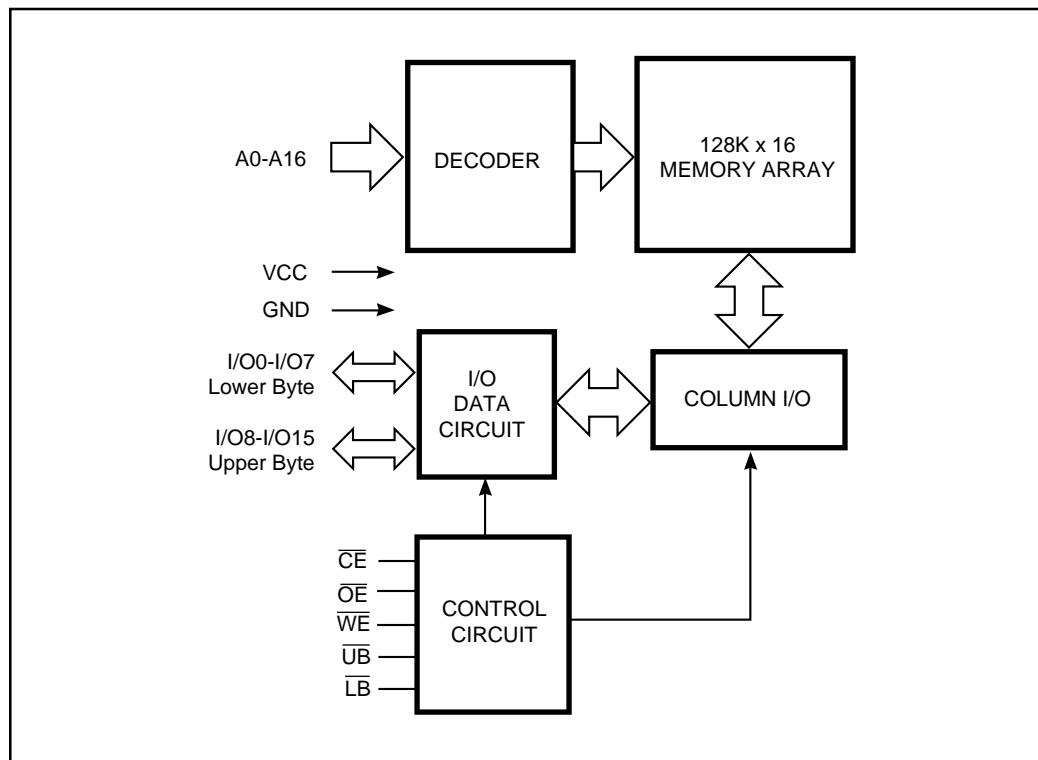

The ICSIC62LV12816L and IC62LV12816LL are high-speed, 2,097,152-bit static RAMs organized as 131,072 words by 16 bits. They are fabricated using ICSIs high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields high-performance and low power consumption devices.

When \overline{CE} is HIGH (deselected) or when \overline{CE} is low and both \overline{LB} and \overline{UB} are HIGH, the device assumes a standby mode at which the power dissipation can be reduced by using CMOS input levels.

Easy memory expansion is provided by using Chip Enable Output and Enable inputs, CE and OE . The active LOW Write Enable (\overline{WE}) controls both writing and reading of the memory. A data byte allows Upper Byte (\overline{UB}) and Lower Byte (\overline{LB}) access.

The IC62LV12816L and IC62LV12816LL are packaged in the JEDEC standare 44-pin 400mil TSOP-2 and 48-pin 6*8mm TF-BGA.

Notes:

1. \overline{WE} is HIGH for a Read Cycle.
2. The device is continuously selected. \overline{OE} , \overline{CE} , \overline{UB} , or $\overline{LB} = V_{IL}$.
3. Address is valid prior to or coincident with \overline{CE} LOW transitions.

Notes:

- Test conditions assume signal transition times of 3 ns or less, timing reference levels of 1.3V, input pulse levels of 0.4V to 2.2V and output loading specified in Figure 1.
- The internal write time is defined by the overlap of $\overline{\text{CE}}$ LOW, and $\overline{\text{UB}}$ or $\overline{\text{LB}}$, and $\overline{\text{WE}}$ LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the Write.
- Tested with the load in Figure 2. Transition is measured ± 500 mV from steady-state voltage. Not 100% tested.
- Tested with $\overline{\text{OE}}$ HIGH

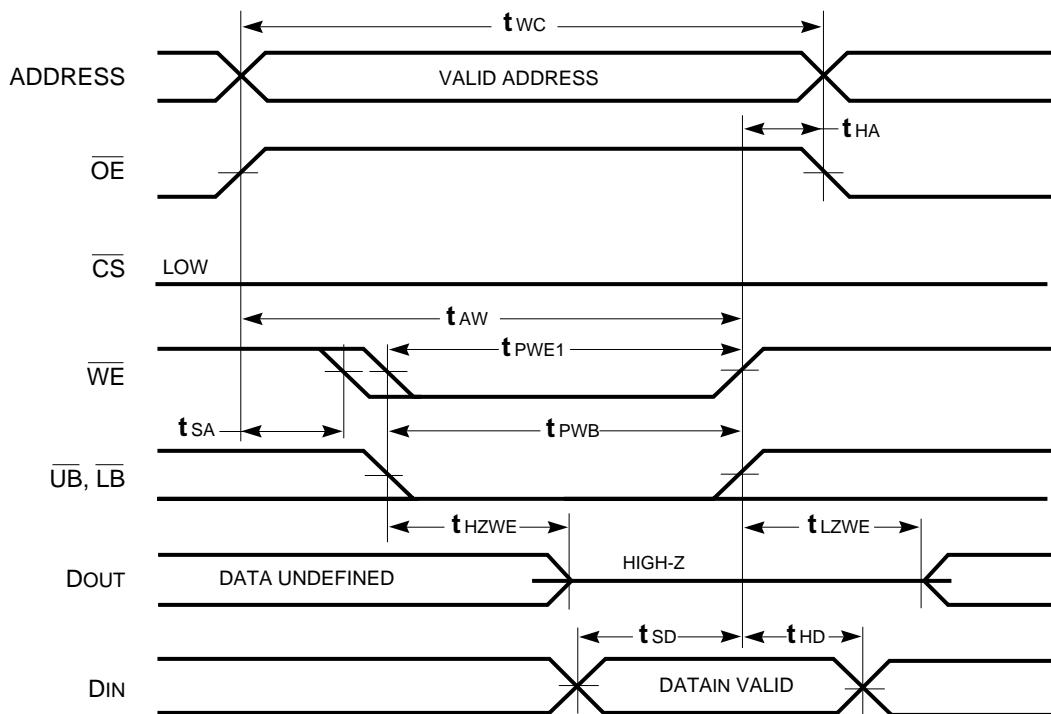

AC WAVEFORMS

WRITE CYCLE NO. 1^(1,2) ($\overline{\text{CS}}$, Controlled, $\overline{\text{OE}} = \text{HIGH}$ or LOW)

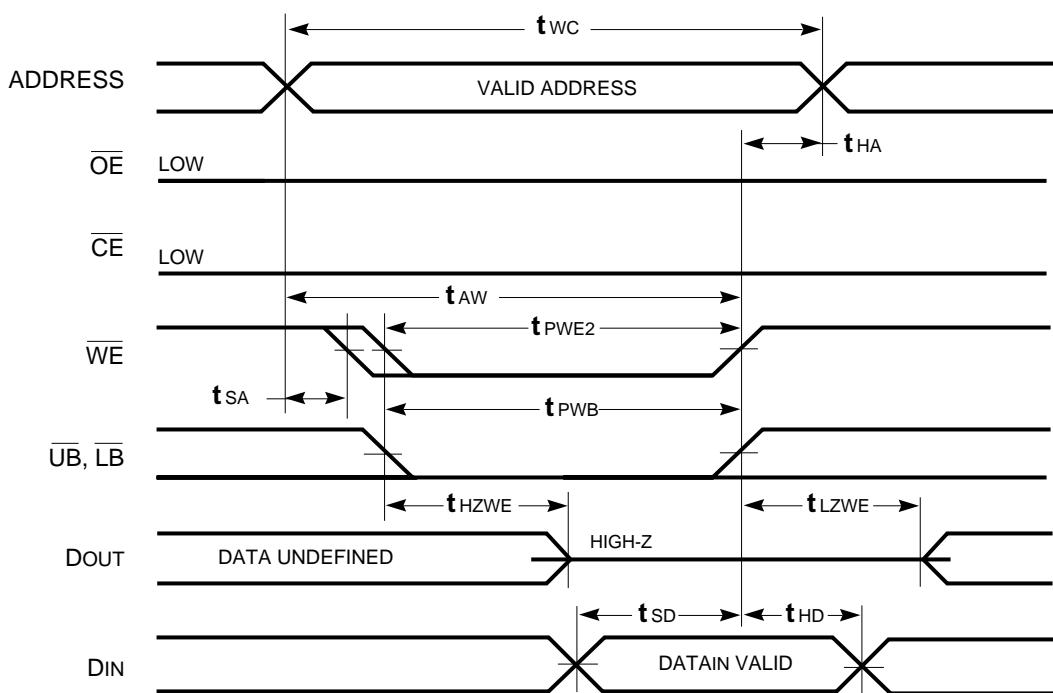

Notes:

- WRITE is an internally generated signal asserted during an overlap of the LOW states on the $\overline{\text{CS}}$ and $\overline{\text{WE}}$ inputs and at least one of the $\overline{\text{LB}}$ and $\overline{\text{UB}}$ inputs being in the LOW state.
- WRITE = ($\overline{\text{CS}}$) [($\overline{\text{LB}}$) = ($\overline{\text{UB}}$)] ($\overline{\text{WE}}$).

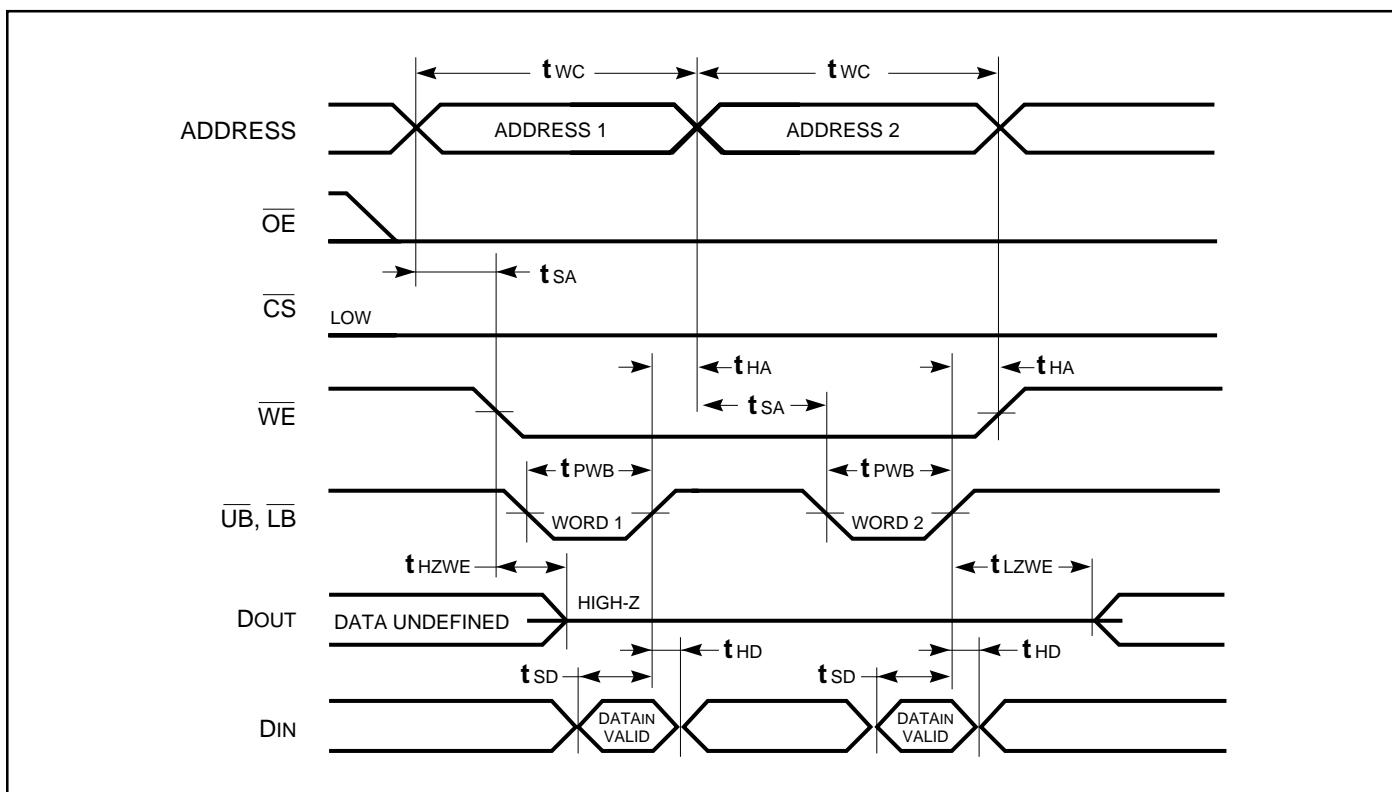

WRITE CYCLE NO. 2 (\overline{WE} Controlled; \overline{OE} is HIGH During Write Cycle)

WRITE CYCLE NO. 3 (\overline{WE} Controlled; \overline{OE} is LOW During Write Cycle)

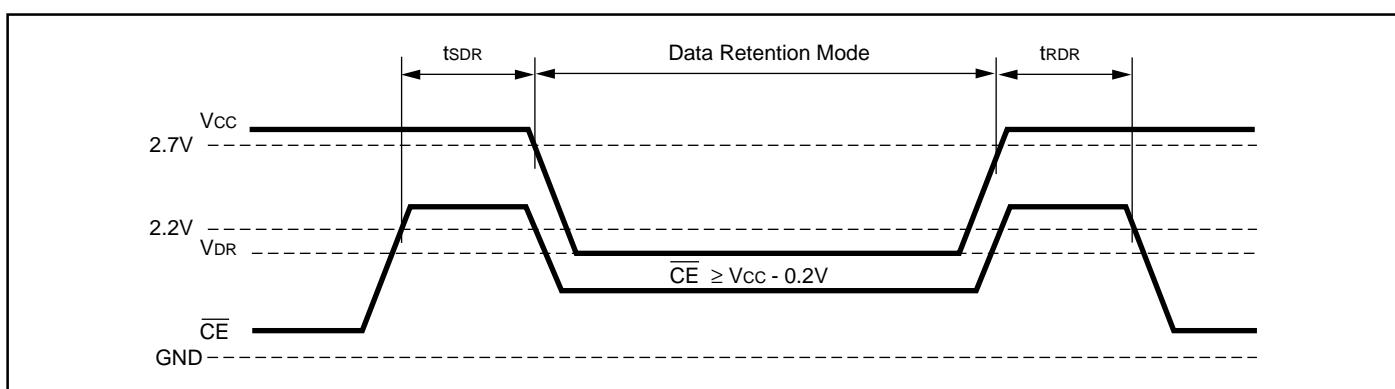

WRITE CYCLE NO. 4 (\overline{UB} / \overline{LB} Controlled)
