Note: Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook (“Handling Precautions”/“Derating Concept and Methods”) and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

The correlation between input current and switching speed and drive circuit (reference information).

Input Current (IF)	TEST CIRCUIT	Typical Switching Speed
12mA	1 (Page 4)	14 – 16 MBd
8mA	1 (Page 4)	11 – 13 MBd
8mA	2 (Page 4,with Speed up capacitor)	16 – 20 MBd

Note 1: Pulse width PW≤1us,300pps.

Note 2: Device Considered a two terminal device : pins 1,2 and 3 shorted together and pins 4,5 and 6 shorted together.

Note 3: The detector of this product requires a power supply voltage (VCC) of 4.5 V or higher for stable operation. If the VCC is lower than this value, an Icc may increase, or an output may be unstable. Be sure to use the product after checking the supply current, and the operation of a power−on/−off.

Note 4: A ceramic capacitor(0.1 μF) should be connected from pin 6 to pin 4 to stabilize the operation of the high gain linear amplifier. Failure to provide the bypassing may impair the switching property. The total lead length between capacitor and coupler should not exceed 1 cm.
