Document Title

256Kx36 & 512Kx18-Bit Pipelined N*t*RAM™

Revision History

Rev. No.	History	Draft Date	Remark
0.0	1. Initial document.	September. 1997	Preliminary

0.1	1. Changed speed bin from 167MHz to 150MHz
	2. Changed DC Parameters;
	  I_{CC} : from 400mA to 450mA , ISB : from 60mA to 20mA
	  I_{SB2} : from 50mA to 85mA
		November. 1997	Preliminary

0.2	1. Changed speed bin from 150MHz to 167MHz
	2. Changed Power from 3.3V to 2.5V
	3. Changed N.C pins to Power and ZZ Pin #14, #16, #64, #66
	4. Changed some control pin names.
	  from CEN to CKE, from BWEx to BWx
	5. Modify absolute maximum ratings
	  V_{DD} ; from 4.0V to 3.6V, V_{IN} ; from 4.6V to 3.6V
	6. Changed DC parameters
	  I_{SB} ; from 20mA to 80mA, I_{SB2} ; from 85mA to 10mA
	  V_{OL} ; from 0.4V to 0.2V, V_{OH} ; from 2.4V to 2.0V
	  V_{IL} ; from 0.8V to 0.7V, V_{IH} ; from 2.0V to 1.7V
	7. ADD the sleep mode timing and characteristics
	  CKE controlled timing and CS controlled timing
		March. 11. 1998	Preliminary

0.3	1. Removed speed bin 167MHz
	2.Changed AC parameters
	  t_{HZOE} ; from 4.0 to 3.5 , t_{HZC};from 4.0 to 3.5 at -75
	  t_{HZOE} ; from 5.0 to 3.5 , t_{HZC};from 5.0 to 3.5 , $t_{CL/H}$; 4.0 to 3.0 at -10
	3.Modify Sleep Mode Waveform.
	  Changed Sleep Mode Electrical Characteristics .
	  t_{PDS} ;from Max 2cycle to Min 2cycle
	  t_{PUS} ; from Max 2cycle to Min 2cycle
		April. 11. 1998	Preliminary

0.4	1.Modify from $\overline{ADV}$ to ADV at timing. 2.ADD the Trade Mark(N*t*RAM™)	June. 02. 1998	Preliminary
0.5	1. Changed DC parameters I_{SB1}; from 10mA to 20mA, I_{SB2} ; from 10mA to 20mA	Aug. 19. 1998	Preliminary
0.6	1. Changed t_{CD},t_{OE} from 4.0ns to 4.2ns at -75.	Sep. 28. 1998	Preliminary

0.7	1. Changed DC condition at Icc and parameters
	  I_{CC} ; from 420mA to 320mA at -67 , from 370mA to 300mA at -75
	    from 300mA to 250mA at -10.
	  I_{SB} ; from 70mA to 60mA at -67 , from 60mA to 50mA at -75
	    from 50mA to 40mA at -10.
		Nov. 10. 1998	Preliminary

0.8	1.Changed V_{OL} Max value from 0.2V to 0.4V .	Dec. 23. 1998	Preliminary
0.9	1. Add 119BGA(7x17 Ball Grid Array Package) .	Mar. 03. 1999	Preliminary
1.0	1. Final spec release	April. 01. 1999	Final
2.0	1. Add t_{CYC} 167Mhz.	Oct. 30. 1999	Final

The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

Document Title

256Kx36 & 512Kx18-Bit Pipelined N*t*RAM^{TM}

Revision History

Rev. No.	History	Draft Date	Remark
3.0	1. Remove 119BGA package .	Nov. 19. 1999	Final

256Kx36 & 512Kx18-Bit Pipelined N*t*RAM™

FEATURES

- 2.5V ±5% Power Supply.
- Byte Writable Function.
- Enable clock and suspend operation.
- Single READ/WRITE control pin.
- Self-Timed Write Cycle.
- Three Chip Enable for simple depth expansion with no data contention .
- A interleaved burst or a linear burst mode.
- Asynchronous output enable control.
- Power Down mode.
- TTL-Level Three-State Outputs.
- 100-TQFP-1420A .

FAST ACCESS TIMES

PARAMETER	Symbol	-16	-15	-13	-10	Unit
Cycle Time	t_{CYC}	6.0	6.7	7.5	10	ns
Clock Access Time	t_{CD}	3.5	3.8	4.2	5.0	ns
Output Enable Access Time	t_{OE}	3.5	3.8	4.2	5.0	ns

GENERAL DESCRIPTION

The K7N803645M and K7N801845M are 9,437,184 bits Synchronous Static SRAMs.

The N*t*RAM™, or No Turnaround Random Access Memory utilizes all the bandwidth in any combination of operating cycles. Address, data inputs, and all control signals except output enable and linear burst order are synchronized to input clock. Burst order control must be tied "High or Low".

Asynchronous inputs include the sleep mode enable(ZZ).

Output Enable controls the outputs at any given time.

Write cycles are internally self-timed and initiated by the rising edge of the clock input. This feature eliminates complex off-chip write pulse generation

and provides increased timing flexibility for incoming signals.

For read cycles, pipelined SRAM output data is temporarily stored by an edge triggered output register and then released to the output buffers at the next rising edge of clock.

The K7N803645M and K7N801845M are implemented with SAMSUNG′s high performance CMOS technology and is available in 100pin TQFP packages. Multiple power and ground pins minimize ground bounce.

SAMSUNG
ELECTRONICS

FUNCTION DESCRIPTION

The K7N803645M and K7N801845M are N*t*RAM™ designed to sustain 100% bus bandwidth by eliminating turnaround cycle when there is transition from Read to Write, or vice versa.
All inputs (with the exception of $\overline{OE}$, $\overline{LBO}$ and ZZ) are synchronized to rising clock edges.

All read, write and deselect cycles are initiated by the ADV input. Subsequent burst addresses can be internally generated by the burst advance pin (ADV). ADV should be driven to Low once the device has been deselected in order to load a new address for next operation.

Clock Enable($\overline{CKE}$) pin allows the operation of the chip to be suspended as long as necessary. When $\overline{CKE}$ is high, all synchronous inputs are ignored and the internal device registers will hold their previous values.

N*t*RAM™ latches external address and initiates a cycle, when $\overline{CKE}$, ADV are driven to low and all three chip enables($\overline{CS}_1$, CS_2, $\overline{CS}_2$) are active .
Output Enable($\overline{OE}$) can be used to disable the output at any given time.

Read operation is initiated when at the rising edge of the clock, the address presented to the address inputs are latched in the address register, $\overline{CKE}$ is driven low, all three chip enables($\overline{CS}_1$, CS_2, $\overline{CS}_2$) are active, the write enable input signals $\overline{WE}$ are driven high, and ADV driven low.The internal array is read between the first rising edge and the second rising edge of the clock and the data is latched in the output register. At the second clock edge the data is driven out of the SRAM. Also during read operation $\overline{OE}$ must be driven low for the device to drive out the requested data.

Write operation occurs when $\overline{WE}$ is driven low at the rising edge of the clock. BW[d:a] can be used for byte write operation. The pipe-lined N*t*RAM™ uses a late-late write cycle to utilize 100% of the bandwidth.
At the first rising edge of the clock, $\overline{WE}$ and address are registered, and the data associated with that address is required two cycle later.

Subsequent addresses are generated by ADV High for the burst access as shown below. The starting point of the burst seguence is provided by the external address. The burst address counter wraps around to its initial state upon completion.
The burst sequence is determined by the state of the $\overline{LBO}$ pin. When this pin is low, linear burst sequence is selected.
And when this pin is high, Interleaved burst sequence is selected.

During normal operation, ZZ must be driven low. When ZZ is driven high, the SRAM will enter a Power Sleep Mode after 2 cycles. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM normally operates after 2 cycles of wake up time.

## BURST SEQUENCE TABLE

(Interleaved Burst, $\overline{LBO}$=High)

$\overline{LBO}$ PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
First Address		0	0	0	1	1	0	1	1
↓		0	1	0	0	1	1	1	0
		1	0	1	1	0	0	0	1
Fourth Address		1	1	1	0	0	1	0	0

(Linear Burst, $\overline{LBO}$=Low)

$\overline{LBO}$ PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
First Address		0	0	0	1	1	0	1	1
↓		0	1	1	0	1	1	0	0
		1	0	1	1	0	0	0	1
Fourth Address		1	1	0	0	0	1	1	0

Note : 1. $\overline{LBO}$ pin must be tied to High or Low, and Floating State must not be allowed.

STATE DIAGRAM FOR N*t*RAM™
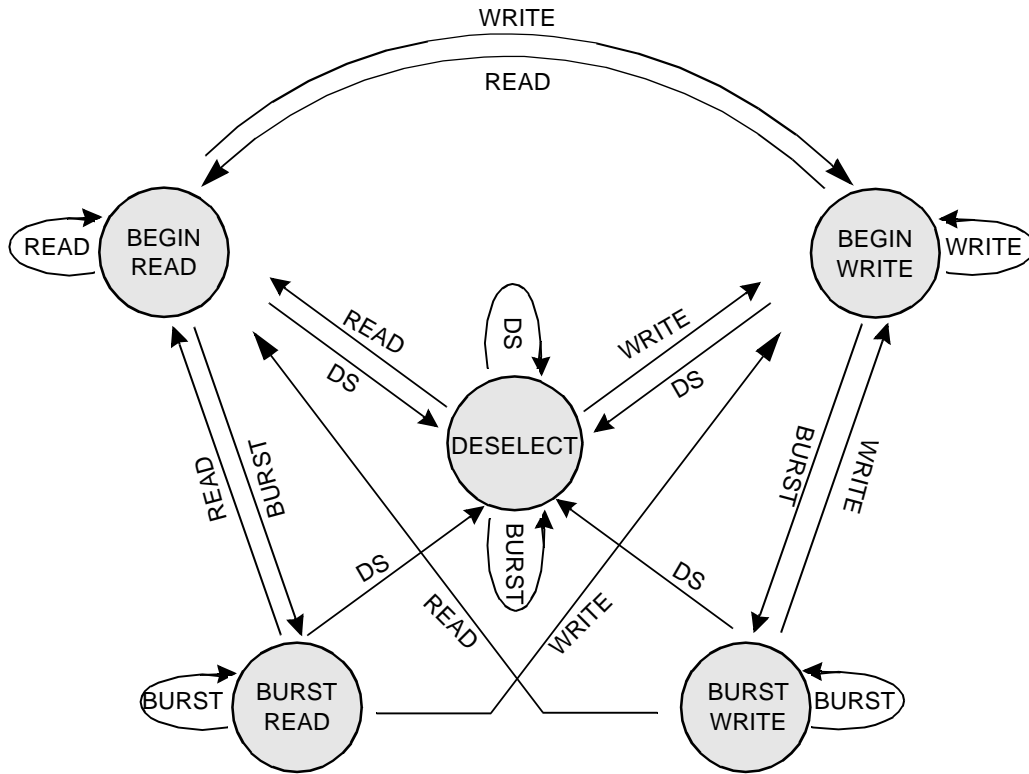

COMMAND	ACTION
DS	DESELECT
READ	BEGIN READ
WRITE	BEGIN WRITE
BURST	BEGIN READ BEGIN WRITE CONTINUE DESELECT

Notes : 1. An IGNORE CLOCK EDGE cycle is not shown is the above diagram. This is because CKE HIGH only blocks the clock(CLK) input and does not change the state of the device.
2. States change on the rising edge of the clock(CLK)

TRUTH TABLES

ZZ High to Power Down	t_{PDS}	2	-	2	-	2	-	2	-	cycle
ZZ Low to Power Up	t_{PUS}	2	-	2	-	2	-	2	-	cycle

Notes : 1. All address inputs must meet the specified setup and hold times for all rising clock(CLK) edges when ADV is sampled low and $\overline{CS}$ is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 2. Chip selects must be valid <u>at each</u> rising edge of CLK(when ADV is Low) to remain enabled.
 3. A write cycle is defined by $\overline{WE}$ low having been registered into the device at ADV Low, A Read cycle is defined by $\overline{WE}$ High with ADV Low, Both cases must meet setup and hold times.
 4. To avoid bus contention, At a given voltage and temperature t_{LZC} is more than t_{HZC}.
 The specs as shown do not imply bus contention because t_{LZC} is a Min. parameter that is worst case at totally different test conditions (0°C,2.625V) than t_{HZC}, which is a Max. parameter(worst case at 70°C,2.375V)
 It is not possible for two SRAMs on the same board to be at such different voltage and temperature.

SAMSUNG
ELECTRONICS

SLEEP MODE

SLEEP MODE is a low current, power-down mode in which the device is deselected and current is reduced to I_{SB2}. The duration of SLEEP MODE is dictated by the length of time the ZZ is in a High state.

After entering SLEEP MODE, all inputs except ZZ become disabled and all outputs go to High-Z

The ZZ pin is an asynchronous, active high input that causes the device to enter SLEEP MODE.
When the ZZ pin becomes a logic High, I_{SB2} is guaranteed after the time t_{ZZI} is met. Any operation pending when entering SLEEP MODE is not guaranteed to successful complete. Therefore, SLEEP MODE (READ or WRITE) must not be initiated until valid pending operations are completed. similarly, when exiting SLEEP MODE during t_{PUS}, only a DESELECT or READ cycle should be given while the SRAM is transitioning out of SLEEP MODE.

SLEEP MODE ELECTRICAL CHARACTERISTICS

(V_{DD}, V_{DDQ}=2.5V $\pm$5%)

DESCRIPTION	CONDITIONS	SYMBOL	MIN	MAX	UNITS
Current during SLEEP MODE	ZZ $\geq$ V_{IH}	I_{SB2}		10	mA
