

Low Voltage, High Accuracy, Quad Voltage μ P Supervisory Circuit

Preliminary Technical Data

ADM6710

FEATURES

- Accurate monitoring of up to four power supply voltages
- 5 reset threshold options: 1.8 V to 5 V
- Monitors down to 0.62 V (1.5% accuracy)
- 200 ms typical reset timeout
- Open-drain **RESET** output (10 μ A internal pull-up)
- Reset output stage: active low, valid to $IN_1 = 1$ V or $IN_2 = 1$ V
- Low power consumption (35 μ A)
- Power supply glitch immunity
- Specified from -40°C to $+85^\circ\text{C}$
- 6-lead SOT-23 package

APPLICATIONS

- Microprocessor systems
- Desktop and notebook computers
- Controllers
- Data storage equipment
- Servers/workstations

GENERAL DESCRIPTION

The ADM6710 is a low voltage, high accuracy supervisory circuit. This device monitors up to four system supply voltages.

If a monitored power supply voltage falls below the minimum voltage threshold, a single active low output asserts, triggering a system reset. The output is open drain with a weak internal pull-up to the monitored IN_2 supply (or to V_{CC} in the case of the ADM67109Q) of typically 10 μ A. Once all voltages rise above the selected threshold level, the reset signal remains low for the reset timeout period (200 ms typical).

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

The ADM6710 output remains valid as long as IN_1 or IN_2 exceeds 1 V, while for the ADM6710Q the output remains valid as long as V_{CC} exceeds 2 V.

The ADM6710 incorporates a variety of internally pretrimmed undervoltage threshold options for monitoring 5.0 V, 3.3 V, 3.0 V, 2.5 V and 1.8 V supply voltages. The device offers up to three adjustable thresholds for monitoring voltages down to 0.62 V.

The ADM6710 is available in a 6-lead SOT-23 package and is suitable for use in a variety of voltage monitoring applications.

ADJUSTABLE THRESHOLD (V_{TH})	0.611	0.620	0.629	V	IN_x decreasing
				% V_{TH}	IN_x increasing relative to IN_x decreasing
RESET THRESHOLD HYSTERESIS (V_{HYST})	0.3				
RESET THRESHOLD TEMPERATURE COEFFICIENT (TCV_{TH})	60			ppm/ $^\circ\text{C}$	
IN_x to RESET DELAY (t_{RP})	30			μs	V_{IN} falling at 10 mV/ μs from V_{TH} to $V_{TH} - 50\text{ mV}$
RESET TIMEOUT PERIOD (t_{RP})	140	200	280	ms	
RESET OUTPUT LOW (V_{OL})		0.3		V	$V_{IN2}, V_{CC} = 5\text{ V}$, $I_{SINK} = 2\text{ mA}$
		0.4		V	$V_{IN2}, V_{CC} = 2.5\text{ V}$, $I_{SINK} = 1.2\text{ mA}$
		0.3		V	$V_{IN2} = 1.0$, $I_{SINK} = 50\text{ }\mu\text{A}$, $T_A = 0^\circ\text{C}$ to $+85^\circ\text{C}$
RESET OUTPUT HIGH (V_{OH})	$0.8 \times V_{CC}$			V	$V_{CC} \geq 2.0\text{ V}$, $I_{SOURCE} = 6\text{ }\mu\text{A}$, $\overline{\text{RESET}}$ deasserted (ADM6710Q only)
	$0.8 \times V_{CC}$			V	$V_{IN2} \geq 2.0\text{ V}$, $I_{SOURCE} = 6\text{ }\mu\text{A}$, $\overline{\text{RESET}}$ deasserted
RESET OUTPUT HIGH SOURCE CURRENT (I_{OH})	10			μA	$V_{IN2} \geq 2.0\text{ V}$, $\overline{\text{RESET}}$ deasserted

¹ Note that the ADM6710Q is powered from V_{CC} .

² The RESET output is guaranteed to be in the correct state for IN_1 or IN_2 down to 1 V.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
V_{CC} , IN_x , $\overline{RESET}$ to GND	–0.3 V to +6 V
Continuous $\overline{RESET}$ Current	20 mA
Continuous Power Dissipation	450 mW
Storage Temperature Range	–65°C to +125°C
Operating Temperature Range	–40°C to +85°C
Lead Temperature (10 sec)	300°C
Junction Temperature	150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2.

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	IN ₁	Input Voltage 1.
2	IN ₂	Input Voltage 2. IN ₂ is the power supply input for the ADM6710.
	V _{CC}	V _{CC} is the power supply input for the ADM6710Q. It is not a monitored input.
3	IN ₃	Input Voltage 3.
4	IN ₄	Input Voltage 4.
5	GND	Ground.
6	RESET	RESET goes low when an input drops below the specified threshold. Once all inputs rise above the threshold voltage, RESET remains low for 200 ms (typical) before going high. The RESET output is open drain with a weak internal pull-up to IN ₂ or, in the case of the ADM6710Q to V _{CC} , typically 10 μA.

THEORY OF OPERATION

The ADM6710 is a compact, low power supervisory circuit capable of monitoring up to four voltages in multivoltage applications. If a monitored power supply voltage falls below the minimum voltage threshold, a single active low output asserts, triggering a system reset.

The ADM6710 includes several voltage threshold options for monitoring 5.0 V, 3.3 V, 3.0 V, 2.5 V and 1.8 V supplies. It also provides up to three adjustable thresholds for monitoring voltages down to 0.62 V. See the Ordering Guide section for a list and description of all options available.

The ADM6710 includes precision comparators, an accurate band gap reference, and a series of internally-trimmed resistor divider networks to set the factory-fixed reset threshold options. The resistor networks scale the specified INx reset voltages to match the internal band gap reference/comparator voltage.

Adjustable threshold options bypass the internal resistor networks and connect directly to one of the comparator inputs. External resistor divider networks must be used to scale voltages down for monitoring at the adjustable inputs. The ADM6710Q provides a separate unmonitored power supply input (V_{CC}) and three adjustable voltage inputs.

The internal comparators each typically have a hysteresis of 0.3% with respect to its reset threshold. This built-in hysteresis improves the device's immunity to ambient noise without noticeably reducing the threshold accuracy. The ADM6710 is unaffected by short input transients.

Figure 3. Typical Applications Circuit

INPUT CONFIGURATION

The ADM6710 provides numerous monitor choices with adjustable reset thresholds. Typically, the threshold voltage at each adjustable INx input is 0.62 V. To monitor a voltage greater than 0.62 V, connect a resistor divider network to the circuit as depicted in Figure 4, where

$$V_{INTH} = 0.62 V \left(\frac{R_1 + R_2}{R_2} \right)$$

Figure 4. Setting the Adjustable Monitor

The ADM6710Q contains an internal voltage clamp at each of the adjustable voltage inputs. Input voltages greater than 1.5 V induce a higher input current.

The ADM6710 is normally powered from the monitored IN₂, or V_{CC} in the case of the ADM6710Q. Monitored inputs are resistant to short power supply glitches. To increase noise immunity in noisy applications, place a 0.1 μF capacitor between the IN₂ input and ground. Adding capacitance to IN₁, IN₃, and IN₄ also improves noise immunity.

Do not allow unused monitor inputs to float or to be grounded. Connect these inputs to a supply voltage greater than their specified threshold voltages. In the case of unused INx adjustable inputs, limit the bias current by connecting a 1 MΩ series resistor between the unused input and IN₂ (or V_{CC} with the ADM6710Q).

RESET OUTPUT CONFIGURATION

The ADM6710 has a reset timeout period of 200 ms (typical). The output is open drain with a weak internal pull-up to the monitored IN₂ or V_{CC} supply, typically 10 uA.

In many applications that interface with other logic devices, there is no requirement for an external pull-up resistor. An external pull-up resistor to any voltage, ranging from 0 V to 5.5 V, can overdrive the internal pull-up when interfacing to different logic supply voltages (see Figure 5). Reverse current flow from the external pull-up voltage to IN₂ is prevented by the internal circuitry.

Figure 5. Interface with a Different Logic Supply Voltage

The ADM6710Q is powered by V_{CC}, which is not a monitored voltage. All other ADM6710 options are powered by IN₂, which is a monitored voltage. If a supply voltage drops below its associated threshold, the reset output asserts low and remains low while either IN₁ or IN₂ remains above 1.0 V.

ADDITION OF MANUAL RESET

Figure 6. Addition of Manual Reset (IN_4 is an Adjustable Input).

Use the circuit shown in Figure 6 to add a manual reset to the ADM6710. When the $\overline{\text{RESET}}$ output commences. The switch must remain open for a minimum of 140 ms for the $\overline{\text{RESET}}$ output to deassert.
