IL3522 Driver

DE	D	$V_{(Y-Z)}$
L	X	Z
H	H	$\geq 200 \text{ mV}$
H	L	$\leq -200 \text{ mV}$

Features

- 3.3 / 5 V Input Supply Compatible
- 2500 V_{RMS} Isolation (1 minute)
- 20 ns Propagation Delay
- 40 Mbps Data Rate
- 1 ns Pulse Skew
- 20 kV/ μ s Transient Immunity
- Thermal Shutdown Protection
- -40°C to +85°C Temperature Range
- 16-pin SOIC Package
- UL1577 and IEC 61010-2001 Approval

Applications

- Security Networks
- Building Environmental Controls
- Industrial Control Networks
- Gaming Systems
- Factory Automation

Description

The IL3522 is a galvanically isolated, high-speed differential bus transceiver, designed for bidirectional data communication on balanced transmission lines. The device uses NVE's patented* IsoLoop spintronic Giant Magnetoresistance (GMR) technology.

The IL3585 delivers an exceptional 2.3 V differential output into a 54 Ω load over the supply range of 4.5 V to 5.5 V. This provides better data integrity over longer cable lengths, even at data rates as high as 40 Mbps. The device is also compatible with 3.3 V input supplies, allowing interface to standard microcontrollers without additional level shifting.

Current limiting and thermal shutdown features protect against output short circuits and bus contention that may cause excessive power dissipation. Receiver inputs feature a "fail-safe if open" design, ensuring a logic high R-output if A/B are floating.

Absolute Maximum Ratings⁽¹⁾

Parameters	Symbol	Min.	Typ.	Max.	Units	Test Conditions

Electrostatic Discharge Sensitivity

This product has been tested for electrostatic sensitivity to the limits stated in the specifications. However, NVE recommends that all integrated circuits be handled with appropriate care to avoid damage. Damage caused by inappropriate handling or storage could range from performance degradation to complete failure.

IL3522 Pin Connections

1	V _{DD1}	Input Power Supply
2	GND ₁	Input Power Supply Ground Return
3	R	Output Data from Bus
4	$\overline{\text{RE}}$	Read Data Enable (if $\overline{\text{RE}}$ is high, R = high impedance)
5	DE	Drive Enable
6	D	Data Input to Bus
7	NC	No Internal Connection
8	GND ₁	Input Power Supply Ground Return
9	GND ₂	Output Power Supply Ground Return
10	ISODE	Isolated DE Output for use in Profibus applications where the state of the isolated drive enable node needs to be monitored
11	Y	Y Bus (Drive – True)
12	Z	Z Bus (Drive – Inverse)
13	B	B Bus (Receive – Inverse)
14	A	A Bus (Receive – True)
15	GND ₂	Output Power Supply Ground Return
16	V _{DD2}	Output Power Supply

Driver Section

Electrical Specifications are T_{min} to T_{max} and $V_{DD} = 4.5$ V to 5.5 V, unless otherwise stated.

Parameters	Symbol	Min.	Typ. ⁽⁵⁾	Max.	Units	Test Conditions
Input Clamp Voltage	V_{IK}			-1.5	V	$I_L = -18$ mA
Output voltage	V_O			V_{DD}	V	$I_O = 0$
Differential Output Voltage ⁽¹²⁾	$ V_{OD1} $			V_{DD}	V	$I_O = 0$
Differential Output Voltage ⁽¹²⁾	$ V_{OD2} $	2.5	3	5	V	$R_L = 54 \Omega$, $V_{DD} = 5$ V
Differential Output Voltage ^(12, 6)	V_{OD3}	2.3		5	V	$R_L = 54 \Omega$, $V_{DD} = 4.5$ V
Change in Magnitude of Differential Output Voltage ⁽⁷⁾	$\Delta V_{OD} $			± 0.2	V	$R_L = 54 \Omega$ or 100Ω
Common Mode Output Voltage	V_{OC}			3	V	$R_L = 54 \Omega$ or 100Ω
Change in Magnitude of Common Mode Output Voltage ⁽⁷⁾	$\Delta V_{OC} $			± 0.2	V	$R_L = 54 \Omega$ or 100Ω
Output Current ⁽⁴⁾	I_O			1 -0.8	mA	Output Disabled, $V_O = 12$ $V_O = -7$
High Level Input Current	I_{IH}			10	μ A	$V_I = 3.5$ V
Low Level Input Current	I_{IL}			-10	μ A	$V_I = 0.4$ V
Absolute [Short-circuit Output Current]	I_{OS}			250	mA	-7 V $> V_O < 12$ V
Supply Current	$V_{DD1} = +5$ V	I_{DD1}	4	6	mA	No Load (Outputs Enabled)
	$V_{DD1} = +3.3$ V	I_{DD1}	3	4		

Notes (apply to both driver and receiver sections):

1. All Voltage values are with respect to network ground except differential I/O bus voltages.
2. Differential input voltage is measured at the noninverting terminal A with respect to the inverting terminal B.
3. Skew limit is the maximum propagation delay difference between any two devices at 25°C .
4. The power-off measurement in ANSI Standard EIA/TIA-422-B applies to disabled outputs only and is not applied to combined inputs and outputs.
5. All typical values are at $V_{DD1}, V_{DD2} = 5$ V or $V_{DD1} = 3.3$ V and $T_A = 25^\circ\text{C}$.
6. -7 V $< V_{CM} < 12$ V; 4.5 V $< V_{DD} < 5.5$ V.
7. $\Delta|V_{OD}|$ and $\Delta|V_{OC}|$ are the changes in magnitude of V_{OD} and V_{OC} , respectively, that occur when the input is changed from one logic state to the other.
8. This applies for both power on and power off, refer to ANSI standard RS-485 for exact condition. The EIA/TIA-422-B limit does not apply for a combined driver and receiver terminal.
9. Includes 10 ns read enable time. Maximum propagation delay is 25 ns after read assertion.
10. Pulse skew is defined as $|t_{PLH} - t_{PHL}|$ of each channel.
11. Absolute Maximum specifications mean the device will not be damaged if operated under these conditions. It does not guarantee performance.
12. Differential output voltage is measured at terminal Y with respect to Z.

Receiver Section

Electrical Specifications are T_{min} to T_{max} and $V_{DD} = 4.5\text{ V}$ to 5.5 V , unless otherwise stated.

Parameters	Symbol	Min.	Typ. ⁽⁵⁾	Max.	Units	Test Conditions
Positive-going Input Threshold Voltage ⁽²⁾	V_{IT+}			0.2	V	$-7\text{ V} > V_{CM} < 12\text{ V}$
Negative-going Input Threshold Voltage ⁽²⁾	V_{IT-}	-0.2			V	$-7\text{ V} > V_{CM} < 12\text{ V}$
Hysteresis Voltage ($V_{IT+} - V_{IT-}$)	V_{HYS}		40		mV	$V_{CM} = 0\text{ V}$, $T = 25^\circ\text{C}$
High Level Digital Output Voltage	V_{OH}	$V_{DD} - 0.2$	V_{DD}		V	$V_{ID} = 200\text{ mV}$ $I_{OH} = -20\text{ }\mu\text{A}$
Low Level Digital Output Voltage	V_{OL}			0.2	V	$V_{ID} = -200\text{ mV}$ $I_{OH} = 20\text{ }\mu\text{A}$
High-impedance-state output current	I_{OZ}			± 1	μA	$V_O = 0.4$ to $(V_{DD2} - 0.5)\text{ V}$
Line Input Current ⁽⁸⁾	I_I			1	mA	$V_I = 12\text{ V}$
				-0.8	mA	$V_I = -7\text{ V}$
Input Resistance	R_I	20			k Ω	
Supply Current	I_{DD2}		5	8	mA	No load (Outputs Enabled)

Switching Characteristics

$V_{DD1} = +5\text{ V}$, $V_{DD2} = +5\text{ V}$						
Parameters	Symbol	Min.	Typ. ⁽⁵⁾	Max.	Units	Test Conditions
Data Rate		40			Mbps	$R_L = 54\text{ }\Omega$, $C_L = 50\text{ pF}$
Propagation Delay ^(2, 9)	t_{PD}		27	35	ns	$V_O = -1.5$ to 1.5 V , $C_L = 15\text{ pF}$
Pulse Skew ^(2, 10)	$t_{SK}(P)$		1	6	ns	$V_O = -1.5$ to 1.5 V , $C_L = 15\text{ pF}$
Skew Limit ⁽³⁾	$t_{SK}(LIM)$		2	12	ns	$R_L = 54\text{ }\Omega$, $C_L = 50\text{ pF}$
Output Enable Time To High Level	t_{PZH}		15	25	ns	$C_L = 15\text{ pF}$
Output Enable Time To Low Level	t_{PZL}		15	25	ns	$C_L = 15\text{ pF}$
Output Disable Time From High Level	t_{PHZ}		15	25	ns	$C_L = 15\text{ pF}$
Output Disable Time From Low Level	t_{PLZ}		15	25	ns	$C_L = 15\text{ pF}$
$V_{DD1} = +3.3\text{ V}$, $V_{DD2} = +5\text{ V}$						
Parameters	Symbol	Min.	Typ. ⁽⁵⁾	Max.	Units	Test Conditions
Data Rate		40			Mbps	$R_L = 54\text{ }\Omega$, $C_L = 50\text{ pF}$
Propagation Delay ^(2, 9)	t_{PD}		30	38	ns	$V_O = -1.5$ to 1.5 V , $C_L = 15\text{ pF}$
Pulse Skew ^(2, 10)	$t_{SK}(P)$		1	6	ns	$V_O = -1.5$ to 1.5 V , $C_L = 15\text{ pF}$
Skew Limit ⁽³⁾	$t_{SK}(LIM)$		4	12	ns	$R_L = 54\text{ }\Omega$, $C_L = 50\text{ pF}$
Output Enable Time To High Level	t_{PZH}		17	27	ns	$C_L = 15\text{ pF}$
Output Enable Time To Low Level	t_{PZL}		17	27	ns	$C_L = 15\text{ pF}$
Output Disable Time From High Level	t_{PHZ}		17	27	ns	$C_L = 15\text{ pF}$
Output Disable Time From Low Level	t_{PLZ}		17	27	ns	$C_L = 15\text{ pF}$

Power Consumption

IsoLoop Isolators achieve their low power consumption from the way they transmit data across the isolation barrier. By detecting the edge transitions of the input logic signal and converting these to narrow current pulses, a magnetic field is created around the GMR Wheatstone bridge. Depending on the direction of the magnetic field, the bridge causes the output comparator to switch following the input logic signal. Since the current pulses are narrow, about 2.5 ns, the power consumption is independent of mark-to-space ratio and solely dependent on frequency. This has obvious advantages over optocouplers, which have power consumption heavily dependent on frequency and time.

Table 2. Typical Dynamic Supply Currents.

Data Rate (Mbps)	I _{DD1}	I _{DD2}
1	100 μ A	100 μ A
10	1 mA	1 mA
20	2 mA	2 mA
40	4 mA	4 mA

Power Supply Decoupling

Both V_{DD1} and V_{DD2} must be bypassed with 47 nF ceramic capacitors. These should be placed as close as possible to V_{DD} pins for proper operation. Additionally, V_{DD2} should be bypassed with a 10 μ F tantalum capacitor.

DC Correctness

The IL3585 incorporates a patented refresh circuit to maintain the correct output state with respect to data input. At power up, the bus outputs will follow the Function Table shown on Page 1. The DE input should be held low during power-up to eliminate false drive data pulses from the bus. An external power supply monitor to minimize glitches caused by slow power-up and power-down transients is not required.

Application Information

Receiver Features

The receiver includes a “fail-safe if open” function that guarantees a high level output if the receiver inputs are unconnected (floating). The receiver output “R” has tri-state capability via the active low RE input.

Driver Features

The RS-422 driver is differential output and delivers at least 1.5 V across a 54 Ω load. Drivers feature low propagation delay skew to maximize bit width and minimize EMI. Drivers have tri-state capability via the active-high DE input.

Receiver Data Rate, Cables and Terminations

The IL3522 is intended for networks up to 4,000 feet (1,200 m), but the maximum data rate decreases as cable length increases. Twisted pair cable should be used in all networks since they tend to pick up noise and other electromagnetically induced voltages as common mode signals, which are effectively rejected by the differential receivers.

Fail-Safe Operation

“Fail-safe operation” is defined here as the forcing of a logic high state on the “R” output in response to an open-circuit condition between the “A” and “B” lines of the bus, or when no drivers are active on the bus.

Proper biasing can ensure fail-safe operation, that is a known state when there are no active drivers on the bus. IL3000-Series Isolated Transceivers include internal pull-up and pull-down resistors of approximately 30 k Ω in the receiver section (R_{FS-INT}; see figure below). These internal resistors are designed to ensure failsafe operation but only if there are no termination resistors. The entire V_{DD} will appear between inputs “A” and “B” if there is no loading and no termination resistors, and there will be more than the required 200 mV with up to four RS-422 worst-case Unit Loads of 12 k Ω . Many designs operating below 1 Mbps or less than 1,000 feet are unterminated. Termination resistors may not be necessary for very low data rates and very short cable runs because reflections have time to settle before data sampling, which occurs at the middle of the bit interval.

In busses with low-impedance termination resistors, however, the differential voltage across the conductor pair will be close to zero with no active drivers. In this case the state of the bus is indeterminate, and the idle bus will be susceptible to noise. For example, with 120 Ω termination resistors (R_T) on each end of the cable, and four Unit Loads (12 k Ω each), without external fail-safe biasing resistors the internal pull-up and pull-down resistors will produce a voltage between inputs “A” and “B” of only about 5 mV. This is not nearly enough to ensure a known state. External fail-safe biasing resistors (R_{FS-EXT}) at one end of the bus can ensure fail-safe operation with a terminated bus. Resistors should be

selected so that under worst-case power supply and resistor tolerances there is at least 200 mV across the conductor pair with no active drivers to meet the input sensitivity specification of the RS-422 standard.

Using the same value for pull-up and pull-down biasing resistors maintains balance for positive- and negative going transitions. Lower-value resistors increase inactive noise immunity at the expense of quiescent power consumption. Note that each Unit Load on the bus adds a worst-case loading of 12 k Ω across the conductor pair, and 32 Unit Loads add 375 Ω worst-case loading. The more loads on the bus, the lower the required values of the biasing resistors.

In the example with two 120 Ω termination resistors and four Unit Loads, 560 Ω external biasing resistors provide more than 200 mV between “A” and “B” with adequate margin for power supply variations and resistor tolerances. This ensures a known state when there are no active drivers. Other illustrative examples are shown in the table below.

Fail-Safe Biasing

R_{FS-EXT}	R_T	Loading	Nominal V_{A-B} (inactive)	Fail-Safe Operation?
Internal Only	None	Four unit loads (12 k Ω ea.)	238 mV	Yes
Internal Only	120 Ω	Four unit loads (12 k Ω ea.)	5 mV	No
560 Ω	120 Ω	Four unit loads (12 k Ω ea.)	254 mV	Yes
510 Ω	120 Ω	32 unit loads (12 k Ω ea.)	247 mV	Yes

Revision History

ISB-DS-001-IL3522-E September 2007	• Changed ordering information to reflect that devices are now fully RoHS compliant with no exemptions.
ISB-DS-001-IL3522-D August 2007	• Reorganized specification tables
ISB-DS-001-IL3522-C April 2007	• Eliminated soldering profile chart
ISB-DS-001-IL3522-B	• Specified “open” input condition in truth table • Added fail-safe biasing section. • Revised package drawing.
ISB-DS-001-IL3522-A	Initial Release

About NVE

NVE is an ISO 9001 Certified Company.

NVE Corporation is a high technology components manufacturer having the unique capability to combine leading edge Giant Magnetoresistive (GMR) materials with integrated circuits to make high performance electronic components. Products include Magnetic Field Sensors, Magnetic Field Gradient Sensors (Gradiometer), Digital Magnetic Field Sensors, Digital Signal Isolators and Isolated Bus Transceivers.

NVE is a leader in GMR research and in 1994 introduced the world's first products using GMR material, a line of GMR magnetic field sensors that can be used for position, magnetic media, wheel speed and current sensing.

NVE is located in Eden Prairie, Minnesota, a suburb of Minneapolis. Please visit our Web site at www.nve.com or call 952-829-9217 for information on products, sales or distribution.
