description

The C40 digital signal processors (DSPs) are 32-bit, floating-point processors manufactured in 0.72- μ m, double-level metal CMOS technology. The 320C40 is a part of the fourth-generation DSPs from Texas Instruments and is designed primarily for parallel processing.

For additional information when designing for cold temperature operation, please see Texas Instruments application report 320C3x, 320C4x and 320MCM42x *Power-up Sensitivity at Cold Temperature*, literature number SGUA001.

operation

The 320C40 has six on-chip communication ports for processor-to-processor communication with no external hardware and simple communication software. This allows connectivity to other C4x processors with no external-glue logic. The communication ports remove input/output bottlenecks, and the independent smart DMA coprocessor is able to handle the CPU input/output burden.

central processing unit

The 320C40 CPU is configured for high-speed internal parallelism for the highest sustained performance. The key features of the CPU are:

- Eight operations/cycle:
 - 40/32-bit floating-point/integer multiply
 - 40/32-bit floating-point/integer arithmetic logic unit (ALU) operation
 - Two data accesses
 - Two address-register updates
- IEEE floating-point conversion
- Divide and square-root support
- C3x assembly language compatibility
- Byte and halfword accessibility

DMA coprocessor

The DMA coprocessor allows concurrent I/O and CPU processing for the highest sustained CPU performance. The key features of the DMA processor are:

- Link pointers that allow DMA channels to autoinitialize without CPU intervention
- Parallel CPU operation and DMA transfers
- Six DMA channels that support memory-to-memory data transfers
- Split-mode operation doubles the available DMA channels to 12 when data transfers to and from a communication port are required.

communication ports

The C40 is the first DSP with on-chip communication ports for processor-to-processor communication with no external hardware and simple communication software. The features of the communication ports are:

- Direct interprocessor communication and processor I/O
- Six communication ports for direct interprocessor communication and processor I/O
- 20M-byte/s bidirectional interface on each communication port for high-speed multiprocessor interface

communication ports (continued)

- Separate 8-word-deep input and output FIFO buffers for processor-to-processor communication and I/O
- Automatic arbitration and handshaking for direct processor-to-processor connection

communication-port software reset (C40 silicon revision $\geq$ 5.0)

The input and output FIFO levels for a communication port can be flushed by writing at least two back-to-back values to its communication-port software-reset address as specified in Table 1. This feature is not present in C40 silicon revision $<$ 5.0. This software reset flushes any word or byte already present in the FIFOs but it does not affect the status of the communication-port pins. Figure 1 shows an example of communication-port-software reset.

Table 1. Communication-Port Software-Reset Address

0	0x0100043

      rets                  ; Return

```

Figure 1. Example of Communication-Port-Software Reset

$\overline{\text{NMI}}$ with bus-grant feature (C40 silicon revision ≥ 5.0)

The 320C40 devices have a software-configurable feature that forces the internal-peripheral bus to ready when the $\overline{\text{NMI}}$ signal is asserted. This feature is not present in C40 silicon revision < 5.0 . The $\overline{\text{NMI}}$ bus-grant feature is enabled when bits 19–18 of the status register (ST) are set to 10b. When enabled, a peripheral bus-grant signal is generated on the falling edge of $\overline{\text{NMI}}$. When $\overline{\text{NMI}}$ is asserted and this feature is not enabled, the CPU stalls on access to the peripheral bus if it is not ready. A stall condition occurs when writing to a full FIFO or reading an empty FIFO. This feature is useful in correcting communication-port errors when used in conjunction with the communication-port software-reset feature.

IDLE2 clock-stop power-down mode (C40 silicon revision ≥ 5.0)

The 320C40 has a clock-stop mode or power-down mode (IDLE2) to achieve extremely low power consumption. When an IDLE2 instruction is executed, the clocks are halted with H1 being held high. To exit IDLE2, assert one of the $\overline{\text{IIOF3}}$ – $\overline{\text{IIOF0}}$ pins configured as an external interrupt instead of a general-purpose I/O. A macro showing how to generate the IDLE2 opcode is given in Figure 2. During this power-down mode:

- No instructions are executed
- The CPU, peripherals, and internal memory retain their previous state.
- The external-bus outputs are idle. The address lines remain in their previous state, the data lines are in the high-impedance state, and the output-control signals are inactive.

```
; -----;
; IDLE2: Macro to generate idle2 opcode          ;
; -----;
IDLE2      .macro
           .word      06000001h
           .endm
```

Figure 2. Example of Software Subroutine Using IDLE2

IDLE2 is exited when one of the five external interrupts ($\overline{\text{NMI}}$ and $\overline{\text{IIOF3}}$ – $\overline{\text{IIOF0}}$) is asserted low for at least four input clocks (two H1 cycles). The clocks then start after a delay of two input clocks (one H1 cycle). The clocks can start in the opposite phase; that is, H1 can be high when H3 was high before the clocks were stopped. However, the H1 and H3 clocks remain 180° out of phase with each other.

During IDLE2 operation, an external interrupt can be recognized and serviced by the CPU if it is enabled before entering IDLE2 and asserted for at least two H1 cycles. For the processor to recognize only one interrupt, the interrupt pin must be configured for edge-trigger mode or asserted less than three cycles in level-trigger mode. Any external interrupt pin can wake up the device from IDLE2, but for the CPU to recognize that interrupt, it must also be enabled. If an interrupt is recognized and executed by the CPU, the instruction following the IDLE2 instruction is not executed until after execution of a return opcode.

When the device is in emulation mode, the CPU executes an IDLE2 instruction as if it were an IDLE instruction. The clocks continue to run for correct operation of the emulator.

DIGITAL SIGNAL PROCESSORS

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

development tools

The C40 is supported by a host of parallel-processing development tools for developing and simulating code easily and for debugging parallel-processing systems. The code generation tools include:

- An ANSI C compiler optimized with a runtime support library that supports use of communication ports and DMA.
- Third-party support for C, C++, and Ada compilers
- Several operating systems available for parallel-processing support, as well as DMA and communication port drivers
- An assembler and linker with support for mapping program and data to parallel processors

The simulation tools include:

- Parallel DSP system-level simulation with LAI hardware verification (HV) model and full function (FF) model
- TI software simulator with high-level language debugger interface for simulating a single processor

The hardware development and verification tools include:

- Parallel processor in-circuit emulator and high-level language debugger: XDS510™
- Parallel processor development system (PPDS) with four 320C40s, local and global memory, and communication port connections

XDS510 is a trademark of Texas Instruments Incorporated.

DIGITAL SIGNAL PROCESSORS

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

signal descriptions

This section gives signal descriptions for the SMJ320C40 device. The SMJ320C40 signal descriptions table lists each signal, the number of pins, operating mode(s) (that is, input, output, or high-impedance state as indicated by I, O, or Z, respectively), and function. All pins labeled NC are not to be connected by the user. A line over a signal name (for example, $\overline{\text{RESET}}$) indicates that the signal is active low (true at a logic-0 level). The signals are grouped according to functions.

SMJ320C40 Signal Descriptions

SIGNAL NAME	NO. OF PINS	TYPE†	DESCRIPTION
GLOBAL BUS EXTERNAL INTERFACE (80 PINS)			
D31–D0	32	I/O/Z	32-bit data port of the global bus external interface
$\overline{\text{DE}}$	1	I	Data-bus-enable signal for the global bus external interface
A30–A0	31	O/Z	31-bit address port of the global bus external interface
$\overline{\text{AE}}$	1	I	Address-bus-enable signal for the global bus external interface
STAT3–STAT0	4	O	Status signals for the global bus external interface
$\overline{\text{LOCK}}$	1	O	Lock signal for the global bus external interface
$\overline{\text{STRB0}}^\ddagger$	1	O/Z	Access strobe 0 for the global bus external interface
$\text{R}/\overline{\text{W0}}^\ddagger$	1	O/Z	Read/write signal for $\overline{\text{STRB0}}$ accesses
$\text{PAGE0}^\ddagger$	1	O/Z	Page signal for $\overline{\text{STRB0}}$ accesses
$\overline{\text{RDY0}}^\ddagger$	1	I	Ready signal for $\overline{\text{STRB0}}$ accesses
$\overline{\text{CE0}}^\ddagger$	1	I	Control enable for the $\overline{\text{STRB0}}$, PAGE0 , and $\text{R}/\overline{\text{W0}}$ signals
$\overline{\text{STRB1}}^\ddagger$	1	O/Z	Access strobe 1 for the global bus external interface
$\text{R}/\overline{\text{W1}}^\ddagger$	1	O/Z	Read/write signal for $\overline{\text{STRB1}}$ accesses
$\text{PAGE1}^\ddagger$	1	O/Z	Page signal for $\overline{\text{STRB1}}$ accesses
$\overline{\text{RDY1}}^\ddagger$	1	I	Ready signal for $\overline{\text{STRB1}}$ accesses
$\overline{\text{CE1}}^\ddagger$	1	I	Control enable for the $\overline{\text{STRB1}}$, PAGE1 , and $\text{R}/\overline{\text{W1}}$ signals
LOCAL BUS EXTERNAL INTERFACE (80 PINS)			
LD31–LD0	32	I/O/Z	32-bit data port of the local bus external interface
$\overline{\text{LDE}}$	1	I	Data-bus-enable signal for the local bus external interface
LA30–LA0	31	O/Z	31-bit address port of the local bus external interface
$\overline{\text{LAE}}$	1	I	Address-bus-enable signal for the local bus external interface
LSTAT3–LSTAT0	4	O	Status signals for the local bus external interface
$\overline{\text{LLOCK}}$	1	O	Lock signal for the local bus external interface
$\overline{\text{LSTRB0}}^\ddagger$	1	O/Z	Access strobe 0 for the local bus external interface
$\text{LR}/\overline{\text{W0}}$	1	O/Z	Read/write signal for $\overline{\text{LSTRB0}}$ accesses
LPAGE0	1	O/Z	Page signal for $\overline{\text{LSTRB0}}$ accesses
$\overline{\text{LRDY0}}$	1	I	Ready signal for $\overline{\text{LSTRB0}}$ accesses
$\overline{\text{LCE0}}$	1	I	Control enable for the $\overline{\text{LSTRB0}}$, LPAGE0 , and $\text{LR}/\overline{\text{W0}}$ signals
$\overline{\text{LSTRB1}}^\ddagger$	1	O/Z	Access strobe 1 for the local bus external interface
$\text{LR}/\overline{\text{W1}}$	1	O/Z	Read/write signal for $\overline{\text{LSTRB1}}$ accesses

† I = input, O = output, Z = high impedance

‡ $\overline{\text{STRB0}}$, $\overline{\text{STRB1}}$ and associated signals ($\text{R}/\overline{\text{W1}}$, $\text{R}/\overline{\text{W0}}$, PAGE0 , PAGE1 , etc.) are effective over the address ranges defined by the STRB ACTIVE bits.

§ HFH package has additional power and ground pins to reduce noise problems.

SMJ320C40, TMP320C40 DIGITAL SIGNAL PROCESSORS

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

**Figure 4. SMJ320C40 Die Numbering Format
(See Table 2)**

The inner lead bond (ILB) pitch for the tape automated bonding (TAB) leadframe is the same as the die bond pad pitch. Table 2 provides a reference for the following:

- A. The TAB lead numbers. The TAB lead numbers are the same as the die bond pad numbers.
- B. The C40 signal identities in relation to the pad numbers
- C. There are 325 bond pad locations, 325 TAB leads, and 324 test pad locations.
- D. The C40 X-,Y-coordinates, where bond pad 82 serves as the origin, (0,0)
- E. The inner lead bond pitch (ILB) is the same as the die bond pitch.
- F. The outer lead pitch is 0.25 ± 0.01 mm.
- G. The test pad pitch is 0.40 ± 0.01 mm.
- H. The tape width is 48 mm.
- I. Outer lead bond (OLB) 18, 19 connect to test pad 18.

In addition, the following notes are significant:

- J. X,Y coordinate data is in microns.
- K. Average pitch is $126 \mu\text{m}$ (4.96 mils).
- L. Smallest pitch value is $126 \mu\text{m}$ (4.96 mils).
- M. The active silicon dimensions are $12424.86 \mu\text{m} \times 12035.52 \mu\text{m}$ (489.16 mils $\times$ 473.83 mils).
- N. The die size is approximately $12598.40 \mu\text{m} \times 12192.00 \mu\text{m}$ (496.00 mils $\times$ 480.00 mils).
- O. Distance from diced silicon to polyimide support ring is $889 \mu\text{m}$ (35.0 mils).
- P. Bond pad dimensions are $108.00 \mu\text{m} \times 108.00 \mu\text{m}$ (4.25 mils $\times$ 4.25 mils).
- Q. Center of bond pad to edge of die minimum (without scribe) = $107.80 \mu\text{m}$ (4.24 mils).
- R. The nominal die thickness is $381 \pm 50.8 \mu\text{m}$ (15 $\pm$ 2 mils).
- S. The polyimide encapsulant thickness is approximately $304.8 \mu\text{m}$ (12 mils).

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

SMJ320C40 device nomenclature

SMJ320C40, TMP320C40

DIGITAL SIGNAL PROCESSORS

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

absolute maximum ratings over operating case temperature range (unless otherwise noted)[†]

Supply voltage range, V_{DD} (see Note 1)	– 0.3 V to 7 V
Input voltage range	– 0.3 V to 7 V
Output voltage range	– 0.3 V to 7 V
Operating case temperature range, T_C (M version)	– 55°C to 125°C
(S version)	– 55°C to 100°C
(C version)	– 25°C to 85°C
(L version)	0°C to 70°C
Storage temperature range, T_{stg}	– 65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS} .

recommended operating conditions (see Note 2)

		MIN	NOM [‡]	MAX	UNIT
V_{DD} Supply voltages (DV_{DD} , etc.)	SMJ320C40-40	4.75	5	5.25	V
	SMJ320C40-50	4.75	5	5.25	
	SMJ320C40-60	4.75	5	5.25	
V_{SS} Supply voltages (CV_{SS} , etc.)		0			V
V_{IH} High-level input voltage	X2/CLKIN	2.6		$V_{DD} + 0.3^*$	V
	CSTRBx, $\overline{CRDYx}^{\S}$, $\overline{CREQx}$, $\overline{CACKx}$	2.2		$V_{DD} + 0.3^*$	
	All other pins	2		$V_{DD} + 0.3^*$	
V_{IL} Low-level input voltage		– 0.3*		0.8	V
I_{OH} High-level output current				– 300	μA
I_{OL} Low-level output current				2	mA
T_C Operating case temperature (see Note 3)	M version	– 55		125	°C
	S version	– 55		100	
	C version	– 25		85	
	L version	0		70	

[‡] All nominal values are at $V_{DD} = 5$ V, T_A (ambient-air temperature)= 25°C.

^{\S} $\overline{CRDYx}$ is 2.6 V minimum for TAB package only.

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

NOTES: 2. All input and output voltage levels are TTL-compatible.

3. T_C MAX at maximum rated operating conditions at any point on case. T_C MIN at initial (time zero) power-up.

electrical characteristics over specified case temperature range (see Note 2)

PARAMETER	TEST CONDITIONS	MIN	TYP [†]	MAX	UNIT
V _{OH} High-level output voltage	V _{DD} = MIN, I _{OH} = MAX	2.4	3		V
V _{OL} Low-level output voltage	V _{DD} = MIN, I _{OL} = MAX		0.3	0.6	V
I _Z Three-state current	V _{DD} = MAX	-20		20	μA
I _I Input current	V _I = V _{SS} to V _{DD}	-10		10	μA
I _{IPU} Input current (TDI, TCK, and TMS)	V _I = V _{SS} to V _{DD} (See Note 4)	-400		20	μA
I _{IPD} Input current ($\overline{\text{TRST}}$)	V _I = V _{SS} to V _{DD} (See Note 4)	-20		400	μA
I _{IC} Input current, X2/CLKIN only	V _I = V _{SS} to V _{DD}	-50		50	μA
I _{CC} Supply current	V _{DD} = MAX, T _A = 25°C, f _x = MAX (See Note 5)	320C40-40		350	mA
		320C40-50		850	
		320C40-60		350	
C _I Input capacitance				15*	pF
C _O Output capacitance				15*	pF

[†] All nominal values are at V_{DD} = 5 V, T_A = 25°C.

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

NOTES: 2. All input and output voltage levels are TTL-compatible.

4. Pins with internal pullup devices: TDI, TCK, TMS. Pin with internal pulldown device: $\overline{\text{TRST}}$.

5. f_x is the input clock frequency. The maximum value (MAX) for the 320C40-40, 320C40-50, and 320C40-60 is 40, 50, and 60 MHz, respectively.

PARAMETER MEASUREMENT INFORMATION

Where: I_{OL} = 2 mA (all outputs)
I_{OH} = 300 μA (all outputs)
V_{Load} = 2.15 V
C_T = 80 pF typical load circuit capacitance.

Figure 5. Test Load Circuit

PARAMETER MEASUREMENT INFORMATION

signal transition levels

TTL-level outputs are driven to a minimum logic-high level of 2.4 V and to a maximum logic-low level of 0.6 V. Output transition times are specified as follows:

For a high-to-low transition on a TTL-compatible output signal, the level at which the output is said to be no longer high is 2 V, and the level at which the output is said to be low is 1 V. For a low-to-high transition, the level at which the output is said to be no longer low is 1 V, and the level at which the output is said to be high is 2 V. See Figure 6.

Figure 6. TTL-Level Outputs

Transition times for TTL-compatible inputs are specified as follows:

For a high-to-low transition on an input signal, the level at which the input is said to be no longer high is 2 V, and the level at which the input is said to be low is 0.8 V. For a low-to-high transition on an input signal, the level at which the input is said to be no longer low is 0.8 V, and the level at which the input is said to be high is 2 V. See Figure 7.

† Exceptions: $\overline{\text{X2}}_{\text{CLKIN}}$ $V_{IH} = 3.12$ V and $\overline{\text{CSTRBx}}$, $\overline{\text{CRDYx}}$, $\overline{\text{CREQx}}$ and $\overline{\text{CACKx}}$ $V_{IH} = 2.64$ V.

Figure 7. TTL-Level Inputs

Timing measurements, excluding T_R , T_F , and T_{disable} (output going to high impedance or an I/O output becoming an input), are referenced from an input trip point of 1.5 V to an output trip point of 2 V. Timing measurements from H1 and H3 are referenced from 2 V on the rising or falling edges. T_R and T_F times are referenced from 20% below V_{OH} minimum to 20% above V_{OL} maximum. T_{disable} times are referenced from an input trip point of 1.5 V to 0.1 V below V_{OH} (TPHZ) or above V_{OL} (TPLZ). The I_{OL} and I_{OH} load current can be increased to reduce the RC time constant during TPHZ and TPLZ testing.

timing parameter symbology

Timing parameter symbols used herein were created in accordance with JEDEC Standard 100-A. To shorten the symbols, pin names that have both global and local applications generally are represented with (L) immediately preceding the basic signal name [for example, (L)RDY represents both the global term RDY and the local term LRDY]. Other pin names and related terminology have been abbreviated as follows, unless otherwise noted:

A	(L)A30–(L)A0 or (L)Ax	H	H1/H3
AE	$\overline{\text{LAE}}$, $\overline{\text{AE}}$, or $\overline{\text{(L)AE}}$	IACK	$\overline{\text{IACK}}$
ASYNCH	asynchronous reset signals	IIOF	$\overline{\text{IIOF(3–0)}}$ or $\overline{\text{IIOFx}}$
BYTE	byte transfer	LOCK	$\overline{\text{LLOCK}}$, $\overline{\text{LOCK}}$, or $\overline{\text{(L)LOCK}}$
CA	$\overline{\text{CACK(0–5)}}$ or $\overline{\text{CACKx}}$	(L)RDY	$\overline{\text{(L)RDY0}}$, $\overline{\text{(L)RDY1}}$, or $\overline{\text{(L)RDYx}}$
CD	C(0–5)D7–C(0–5)D0 or CxDx	P	$t_{\text{c(H)}}$
CE	$\overline{\text{(L)CE0}}$, $\overline{\text{(L)CE1}}$, or $\overline{\text{(L)CEx}}$	PAGE	$\overline{\text{(L)PAGE0}}$, $\overline{\text{(L)PAGE1}}$, or $\overline{\text{(L)PAGEx}}$
CI	X2/CLKIN	RESET	$\overline{\text{RESET}}$
COMM	asynchronous reset signals	RW	$\overline{\text{(L)R/W0}}$, $\overline{\text{(L)R/W1}}$, or $\overline{\text{(L)R/Wx}}$
CONTROL	control signals	S	$\overline{\text{(L)STRB0}}$, $\overline{\text{(L)STRB1}}$, or $\overline{\text{(L)STRBx}}$
CRDY	$\overline{\text{CRDY(0–5)}}$ or $\overline{\text{CRDYx}}$	ST	$\overline{\text{(L)STAT3–(L)STAT0}}$ or $\overline{\text{(L)STATx}}$
CRQ	$\overline{\text{CREQ(0–5)}}$ or $\overline{\text{CREQx}}$	TCK	TCK
CS	$\overline{\text{CSTRB(0–5)}}$ or $\overline{\text{CSTRBx}}$	TDO	TDO
D	$\overline{\text{(L)D31–(L)D0}}$ or $\overline{\text{(L)Dx}}$	TMS	TMS/TDI
DE	$\overline{\text{LDE}}$, $\overline{\text{DE}}$, or $\overline{\text{(L)DE}}$	WORD	word transfer

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

PARAMETER MEASUREMENT INFORMATION

NOTES: A. In this figure, (L)Dx includes D31–D0, LD31–D0, and CxD7–CxD0.

B. (L)Ax includes A30–A0 and LA30–LA0.

C. Control signals LSTRB0, LSTRB1, STRB0, STRB1, (L)STAT3–(L)STAT0, (L)LOCK, (L)R/W0, and (L)R/W1 go high while (L)PAGE0 and (L)PAGE1 go low.

D. Asynchronous reset signals that go into high impedance after RESET goes low include TCLK0, TCLK1, IIOF3–IIOF0, and the communication-port control signals CREQx, CACKx, CSTRBx, and CRDYx (where x = 0, 1, or 2, and y = 3, 4, or 5).

E. Asynchronous reset signals that go to a high-logic level after RESET goes low include CREQy, CACKx, CSTRBx, and CRDYy (where x = 0, 1, or 2, and y = 3, 4, or 5).

F. RESET is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown will occur; otherwise, an additional delay of one clock cycle can occur.

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

timing parameters for $\overline{\text{IIOF3}}\text{--}\overline{\text{IIOF0}}$ interrupt response [$P = t_{c(H)}$] (see Figure 21, Note 7, and Note 8)

NO.		'320C40-40 '320C40-50			'320C40-60			UNIT
		MIN	TYP	MAX	MIN	TYP	MAX	
1	$t_{su}(\text{IIOF-H1L})$ Setup time, $\overline{\text{IIOF3}}\text{--}\overline{\text{IIOF0}}$ before H1 low	11			11*			ns
2	$t_w(\text{IIOF})$ Interrupt pulse duration to ensure one interrupt seen (see Note 9)	P	1.5P	< 2P*	P	1.5P	< 2P*	ns

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

- NOTES: 7. IIOFx is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle can occur.
8. Edge-triggered interrupts require a setup of time (1) and a minimum duration of P. No maximum duration limit exists.
9. Level-triggered interrupts require interrupt pulse duration of at least 1P wide ($P = \text{one H1 period}$) to ensure that the interrupt is seen. It must be less than 2P wide to ensure that it is responded to only once. Recommended pulse duration is 1.5P.

NOTE A: The 'C40 can accept an interrupt from the same source every two H1 clock cycles.

Figure 21. $\overline{\text{IIOF3}}\text{--}\overline{\text{IIOF0}}$ Interrupt Response Timing [$P = t_{c(H)}$]

timing parameters for $\overline{\text{IACK}}$ (see Note 10 and Figure 22)

NO.		'320C40-40 '320C40-50		'320C40-60		UNIT
		MIN	MAX	MIN	MAX	
1	$t_d(\text{H1H-IACKL})$ Delay time, H1 high to $\overline{\text{IACK}}$ low		9		7	ns
2	$t_d(\text{H1L-IACKH})$ Delay time, H1 low to $\overline{\text{IACK}}$ high during first cycle of IACK instruction data read		9		7	ns

NOTE 10: The $\overline{\text{IACK}}$ output is active for the entire duration of the bus cycle and, therefore, is extended if the bus cycle utilizes wait states.

DIGITAL SIGNAL PROCESSORS

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

communication-port word-transfer cycle timing [P=t_{c(H)}] (see Note 11 and Figure 23)

NO.		'320C40-40 [†] '320C40-50 [†] '320C40-60 [†]		UNIT
		MIN	MAX	
1	t _{c(WORD)} [‡] Cycle time, word transfer (4 bytes = 1 word)	1.5P+7	2.5P+17	ns
2	t _{d(CRDYL-CSL)W} * Delay time, $\overline{\text{CRDYx}}$ low to $\overline{\text{CSTRBx}}$ low between back-to-back write cycles	1.5P+7	2.5P+28	ns

[†] For these timing values, it is assumed that the SMJ320C40 that is to receive data is ready to receive data.

[‡] t_{c(WORD)} max = 2.5P + 28 ns + 4(Ⓜ) + 3(Ⓝ + Ⓞ + Ⓟ), where boxed numbers refer to the max values for corresponding parameters in the communication-port byte timing table on the next page (for example, Ⓜ means the value under max for parameter 6 in the table -- a value of 10 ns). This timing assumes that two 'C40s are connected.

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

NOTE 11: These timings apply only to two communicating 'C4xs. When a non-'C4x device communicates with a 'C40, timings can be longer. No restriction exists in this case on how slow the transfer could be except when using early silicon ('C40 P6 1.x or 2.x). See the $\overline{\text{CSTRB}}$ width restriction in Section 8.9.1 of the *TMS320C4x User's Guide* (literature number SPRU063).

 = when signal is an input (clear = when signal is an output)

- NOTES: A. For correct operation during token exchange, the two communicating SMJ320C40s must have CLKIN frequencies within a factor of 2 of each other (in other words, at most, one of the SMJ320C40s can be twice as fast as the other).
B. Begins byte 0 of the next word

Figure 23. Communication-Port Word-Transfer-Cycle Timing [P=t_{c(H)}]

communication-port byte timing parameters (write and read) (see Note 12 and Figure 24)

NO.			'320C40-40 '320C40-50 '320C40-60		UNIT
			MIN	MAX	
1	$t_{su}(CD-CSL)W$	Setup time, CxDx data valid before $\overline{CSTRBx}$ low (write)	2		ns
2	$t_d(CRDYL-CSH)W$	Delay time, $\overline{CRDYx}$ low to $\overline{CSTRBx}$ high (write)	0*	12	ns
3	$t_h(CRDYL-CD)W$	Hold time, CxDx after $\overline{CRDYx}$ low (write)	1		ns
4	$t_d(CRDYH-CSL)W$	Delay time, $\overline{CRDYx}$ high to $\overline{CSTRBx}$ low for subsequent bytes (write)	0*	12	ns
5	$t_c(BYTE)^\dagger$	Cycle time, byte transfer		44	ns
6	$t_d(CSL-CRDYL)R$	Delay time, $\overline{CSTRBx}$ low to $\overline{CRDYx}$ low (read)	0*	10	ns
7	$t_{su}(CSH-CD)R$	Setup time, CxDx valid after $\overline{CSTRBx}$ high (read)	0		ns
8	$t_h(CRDYL-CD)R$	Hold time, CxDx valid after $\overline{CRDYx}$ low (read)	2		ns
9	$t_d(CSH-CRDYH)R$	Delay time, $\overline{CSTRBx}$ high to $\overline{CRDYx}$ high (read)	0*	10	ns

$^\dagger t_c(BYTE) \max = (2 + 4 + 6 + 9)$ where boxed numbers refer to the max values for corresponding parameters in the above table (for example, 6 means the value under max for parameter 6 in the table — a value of 10 ns). This assumes that two 'C40s are connected.

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

NOTE 12: Communication port timing does not include line length delay.

Figure 24. Communication-Port Byte Timing (Write and Read)

SMJ320C40, TMP320C40 DIGITAL SIGNAL PROCESSORS

SGUS017H – OCTOBER 1993 – REVISED OCTOBER 2001

timing parameters for communication-token transfer sequence, input to an output port [$P = t_{c(H)}$][†]
(see Figure 25)

NO.			'320C40-40* '320C40-50* '320C40-60*		UNIT
			MIN	MAX	
1 [†]	$t_d(\text{CAL-CS})T$	Delay time, $\overline{\text{CACKx}}$ low to $\overline{\text{CSTRBx}}$ change from input to a high-level output	$0.5P + 6$	$1.5P + 22$	ns
2 [†]	$t_d(\text{CAL-CRQH})T$	Delay time, $\overline{\text{CACKx}}$ low to start of $\overline{\text{CREQx}}$ going high for token-request acknowledge	$P + 5$	$2P + 26$	ns
3	$t_d(\text{CRQH-CRQ})T$	Delay time, start of $\overline{\text{CREQx}}$ going high to $\overline{\text{CREQx}}$ change from output to an input	$0.5P - 5$	$0.5P + 13$	ns
4	$t_d(\text{CRQH-CA})T$	Delay time, start of $\overline{\text{CREQx}}$ going high to $\overline{\text{CACKx}}$ change from an input to an output level high	$0.5P - 5$	$0.5P + 13$	ns
4.1	$t_d(\text{CRQH-CD})T$	Delay time, start of $\overline{\text{CREQx}}$ going high to CxD7–CxD0 change from inputs driven to outputs driven	$0.5P - 5$	$0.5P + 13$	ns
4.2	$t_d(\text{CRQH-CRDY})T$	Delay time, start of $\overline{\text{CREQx}}$ going high to $\overline{\text{CRDYx}}$ change from an output to an input	$0.5P - 5$	$0.5P + 13$	ns
5	$t_d(\text{CRQH-CSL})T$	Delay time, start of $\overline{\text{CREQx}}$ going high to $\overline{\text{CSTRBx}}$ low for start of word transfer out	$1.5P - 8$	$1.5P + 9$	ns
6	$t_d(\text{CRDYL-CSL})T$	Delay time, $\overline{\text{CRDYx}}$ low at end of word input to $\overline{\text{CSTRBx}}$ low for word output	$3.5P + 12$	$5.5P + 48$	ns

[†] These timing parameters result from synchronizer delays and are referenced from the falling edge of H1. The inputs (that cause the output-signal pins to change values) are sampled on H1 falling. The minimum delay occurs when the input condition occurs just before H1 falling, and the maximum delay occurs when the input condition occurs just after H1 falling.

* On products compliant to MIL-PRF-38535, this parameter is not production tested.

NOTE A: Before the token exchange, $\overline{\text{CREQx}}$ and $\overline{\text{CRDYx}}$ are output signals asserted by the SMJ320C40 that is receiving data. $\overline{\text{CACKx}}$, $\overline{\text{CSTRBx}}$, and CxD7–CxD0 are input signals asserted by the device sending data to the 'C40; these are asynchronous with respect to the H1 clock of the receiving SMJ320C40. After token exchange, $\overline{\text{CACKx}}$, $\overline{\text{CSTRBx}}$, and CxD7–CxD0 become output signals, and $\overline{\text{CREQx}}$ and $\overline{\text{CRDYx}}$ become inputs.

SMJ320C40HFHS60	ACTIVE	CFP	HFH	352	1	TBD	Call TI	N / A for Pkg Type

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited

information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

HFH (R-CQFP-F352)

CERAMIC QUAD FLATPACK WITH NCTB

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - This package is hermetically sealed with a metal lid.
 - The terminals are gold-plated.
 - Leads not shown for clarity purposes
 - Falls within JEDEC MO-134AE

GF (S-CPGA-P325)

CERAMIC PIN GRID ARRAY

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. Index mark can appear on top or bottom, depending on package vendor.
 - D. Pins are located within 0.010 (0,25) diameter of true position relative to each other at maximum material condition and within 0.030 (0,76) diameter relative to the edge of the ceramic.
 - E. This package can be hermetically sealed with metal lids or with ceramic lids using glass frit.
 - F. The pins can be gold-plated or solder-dipped.
 - G. Package thickness of 0.165 (4,19) / 0.120 (3,05) includes package body and lid.
 - H. Falls within JEDEC MO-128AK

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
