Circuit Schematic

Notes:

- Φ_v is the total steady state flux of the assembly after thermal stabilization.
- The thermal resistance assumed is $R_{th-junction-ambient}=12.9^{\circ}C/W$, which represents the thermal resistance of the LED assembly when the substrate is potted in epoxy resin. To determine junction temperature, multiply R_{th} by power consumption and add to ambient temperature.
- No LED emits more than 2 times the flux of any other LED within the same assembly.

Notes:

- The dominant wavelength is derived from the CIE Chromaticity Diagram and represents the perceived color of the signal.
- The dominant wavelength does not vary between emitters by more than 8nm within the same assembly.
