

TOSHIBA CMOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

T6B66BFG

ROW DRIVER LSI FOR DOT MATRIX LCD

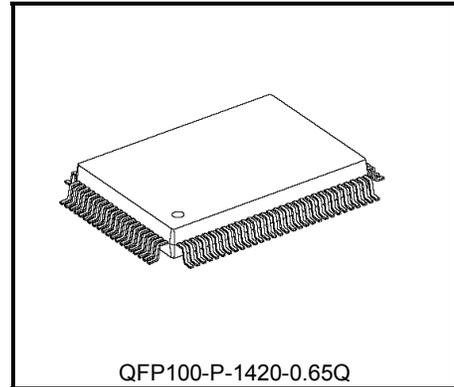

The T6B66BFG is a row (common) driver LSI for a small- or medium-scale dot matrix LCD.

The T6B66BFG generates timing signals for the display using an on-chip oscillator and also controls the T6B65AFG column (segment) LCD driver.

Four duty options are available: 1/17, 1/33, 1/49 and 1/65.

The IC is equipped with 65 low-impedance row-driver outputs. Moreover, the IC incorporates internal resistors to divide the bias voltage, a power supply operational amplifier, DC-DC converter and a contrast control circuit; it is therefore easy to construct a low-power LCD system consisting of a T6B66BFG and a T6B65AFG column (segment) LCD driver.

T6B66BFG is lead (Pb)-free product.

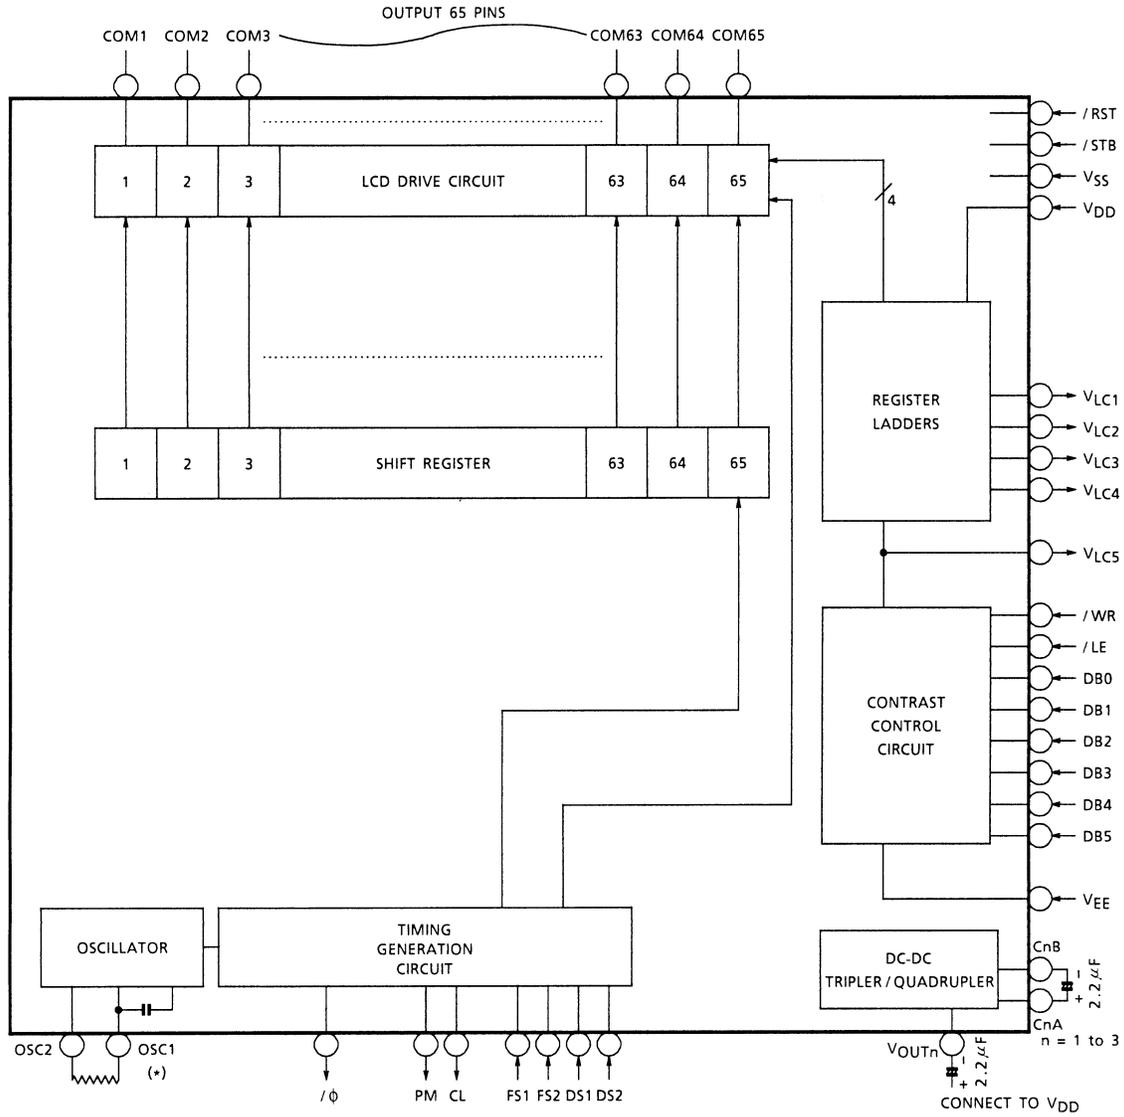

Weight: 1.6 g (typ.)

Features

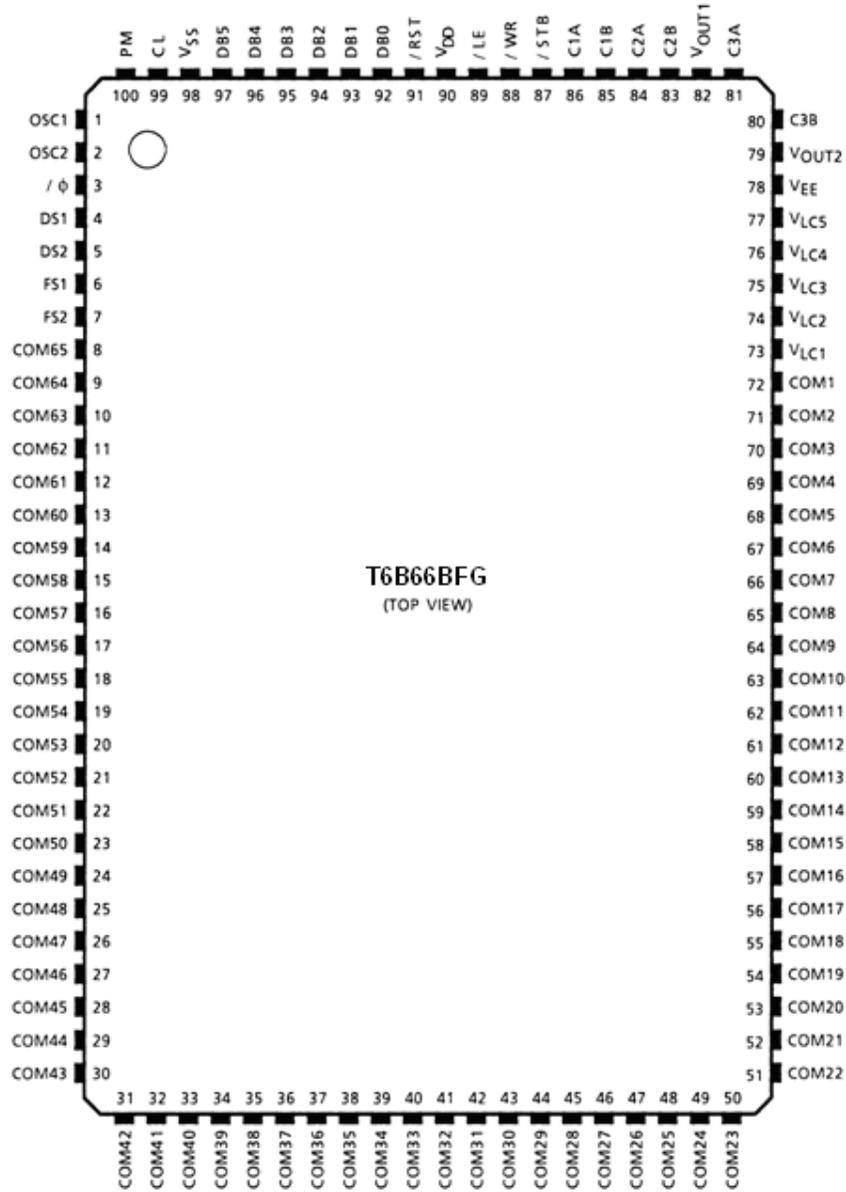

- Row signal for LCD
- 65 low-impedance LCD driver outputs
- On-chip oscillator with external resistor and internal capacitor
- Duty : 1/17, 1/33, 1/49, 1/65
- Low power consumption
- Logic power supply : 2.7 to 5.5 V
- LCD power supply : $V_{DD} - 4.0$ to $V_{DD} - 16.0$ V
- CMOS Si-Gate process
- 100-pin plastic flat package

Block Diagram

*: When external clock operation is used, the clock should be input to OSC1.

Function of Each Block

- **Oscillator**

The T6B66BFG has an on-chip oscillator with one external resistor.

Relation between oscillation frequency and R_f

R_f	f_{OSC}	FS1	FS2
51 k Ω	430 kHz	H	H
110 k Ω	215 kHz	L	H
460 k Ω	54 kHz	H	L
1100 k Ω	27 kHz	L	L

Note: The resistance values are typical values. The oscillation frequency depends on how the device is mounted. It is necessary to adjust the oscillation frequency to a target value.

- **Timing generation circuit**

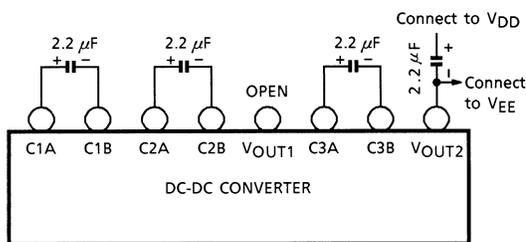

This circuit divides the signals from the oscillator and generates display timing signals (CL, PM) and the operating clock (ϕ) signal.

- **Shift register**

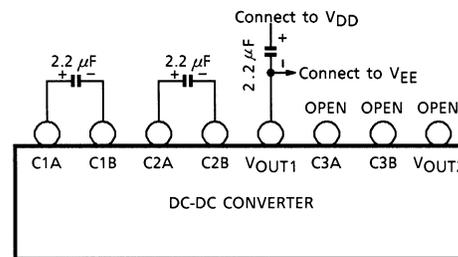

65-bit shift register

- **DC-DC converter (tripler and quadrupler)**

The T6B66BFG has an on-chip DC-DC tripler and quadrupler. When $/STB = L$, V_{OUT1} and $V_{OUT2} = V_{DD}$. A 2.2 to 10- μF capacitor is recommended for this DC-DC Converter.

Quadrupler mode

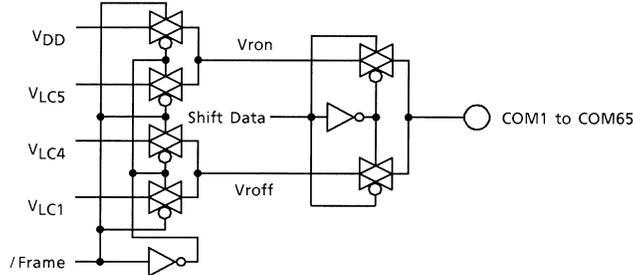

Tripler mode

When not using the DC-DC converter, leave the C_nA , C_nB and V_{OUTn} pins open and connect an external VEE supply.

● Row driver circuit and LCD voltage generation circuit

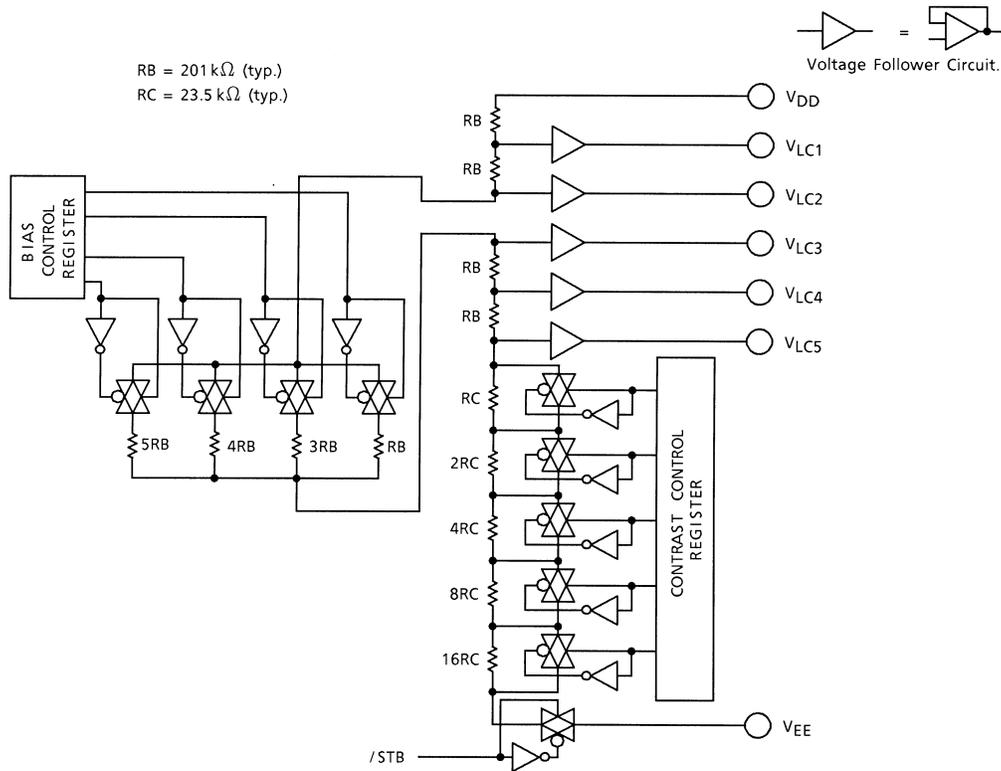

The row driver circuit consists of 65 driver circuits. The combination of the data from the shift register and the Frame signal selects one of the four LCD levels. Details of the voltage generation circuit and the row driver circuit are shown in the diagram below.

● Resistor ladder, contrast control circuit

The T6B66BFG has an on-chip resistor with an op-amp, bias selector and a contrast control circuit. The contrast control circuit allows 32 levels of contrast adjustment by software. The bias selector uses software to select the bias: 1 / 5, 1 / 7, 1 / 8 or 1 / 9.

Details of the resistor ladder and the contrast control circuit are shown in the diagram below.

Command Details

Code						Function
DB5	DB4	DB3	DB2	DB1	DB0	
1	CONTRAST (0 to 31)					Set Contrast
0	1	1	*	*	*	Test Mode Select
0	1	0	1	1 / 0	1 / 0	Op-Amp Control OP1
0	1	0	0	*	1 / 0	Op-Amp ON / OFF
0	0	0	1	R ₁	R ₂	Bias Control
0	0	0	0	1	1 / 0	Display ON / OFF

*: INVALID

- **Set contrast**

DB5	DB4	DB3	DB2	DB1	DB0
1	D	D	D	D	D

Range: 20H to 3FH

This command sets the contrast for the LCD. The T6B66BFG has 32 levels of contrast: 20H (bright) ← → 3FH (dark).

- **Test mode select**

DB5	DB4	DB3	DB2	DB1	DB0
0	1	1	*	*	*

*: INVALID

This command selects the test mode. Do not use this command.

- **Op-Amp control 1 (OP1)**

DB5	DB4	DB3	DB2	DB1	DB0
0	1	0	1	1 / 0	1 / 0

Range: 14H to 17H

This command sets the power supply level for the op-amp. This command selects one of four levels. The command 14H selects the lowest level and 17H the maximum level.

Notes: When L is input to / RST, the power supply level is the minimum level.

● **Op-amp ON / OFF**

DB5	DB4	DB3	DB2	DB1	DB0	Op-amp ON (0) / OFF (1) *: INVALID
0	1	0	0	*	1 / 0	

Range: 10H to 11H
 This command sets the op-amp ON / OFF.
 When using an external op-amp, the command 11H is used.

● **Bias control**

DB5	DB4	DB3	DB2	DB1	DB0	
0	0	0	1	1 / 0	1 / 0	

SET UP	BIAS
04H	1 / 5
05H	1 / 7
06H	1 / 8
07H	1 / 9

Range: 04H to 07H
 This command sets the bias for the LCD power supply.

● **Display ON / OFF**

DB5	DB4	DB3	DB2	DB1	DB0	Display ON (1) / OFF (0)
0	0	0	0	1	1 / 0	

Range: 02H to 03H
 This command controls the display ON / OFF setting.
 When the display is OFF, all the common output waveforms return to the VDD level.
 Note: When L is input to / RST, the display is set to OFF.

Absolute Maximum Ratings (Ta = 25°C)

Item	Symbol	Rating	Unit
Supply Voltage (1)	V _{DD} (Note 1)	-0.3 to 7.0	V
Supply Voltage (2)	V _{EE1, 2} (Note 3)	V _{DD} - 18.0 to V _{DD} + 0.3	V
Input Voltage	V _{in} (Note 1, 2)	-0.3 to V _{DD} + 0.3	V
Operating Temperature	T _{opr}	-20 to 75	°C
Storage Temperature	T _{stg}	-55 to 125	°C

Note 1: Referenced to V_{SS}
 Note 2: Applies to data bus and I / O pins
 Note 3: Ensure that the following condition is always maintained:
 V_{DD} ≥ V_{EE1}, V_{EE2}.
