

10-18GHz Low Noise, Variable Gain Amplifier

GaAs Monolithic Microwave IC

preliminary

Description

The CHA2290 is a high gain four-stage monolithic low noise amplifier with variable gain. It is designed for a wide range of applications, from military to commercial communication systems. The backside of the chip is both RF and DC grounded. This helps to simplify the assembly process.

The circuit is manufactured with a PM-HEMT process, 0.25μm gate length, via holes through the substrate, air bridges and electron beam gate lithography. It is available in chip form.

Typical on wafer measurements : Gain & NF
