● Frequency coefficient of rated ripple current

Frequency (Hz)	60	120	360	1k	10k~
Coefficient	0.82	1.00	1.20	1.35	1.40

(※ 1) • Standard ripple current:

Ripple current value allowable for the life time of 20,000 hours at 85°C.
(5,000 hours at 85°C for the voltage rating of 500V and 550V. 2,000 hours at 85°C for the voltage rating of 630V)

(※ 2) • Maximum rated ripple current:

Ripple current value allowable for the life time of 5,000 hours at 85°C.

• Estimated life time of capacitor is calculated by the following formula, taking the operating temperature, inner temperature rise due to the ripple and derated voltage into consideration.

$$L_n = L_0 \times 2^{\frac{85-T}{10}} \times 2^{\frac{-\Delta T}{K}} \times \alpha$$

Where,

L_n : Lifetime under normal operating conditions.(h)

L_0 : Lifetime under maximum operating temperature of 85°C and applied DC voltage. (28000h)

T : Ambient temperature.(°C)

ΔT : Inner temperature rise of capacitor due to ripple current(°C)

K : Acceleration coefficient for temperature rise due to the ripple current.
when $T+\Delta T \leq 90^\circ\text{C}$, $K=10$

when $T+\Delta T > 90^\circ\text{C}$, $K=2.5$

α : Life factor

• Life factor α due to the voltage derating shall be decided by the temperature and the applied voltage
