

## Features

- 6 configurable IOs supporting
  - CapSense buttons
  - LED drive
  - Interrupt outputs
  - WAKE on interrupt input
  - User defined input or output
- 2.4V to 5.25V operating voltage
- Industrial temperature range: -40°C to +85°C
- I<sup>2</sup>C slave interface for configuration
  - Selectable to 50 kHz, 100 kHz and 400 kHz.
- Reduce BOM cost
  - Internal oscillator - no external oscillators or crystal
  - Free development tool - no external tuning components
- Low operating current
  - Active current: continuous sensor scan: 1.5 mA
  - Sleep current: no scan, continuous sleep: 2.6 uA
- Available in 16-pin COL and 16-pin SOIC packages

## Overview

The CapSense Express™ controller allows the control of 6 IOs configurable as capacitive sensing buttons or as GPIOs for driving LEDs or interrupt signals based on various button conditions. The GPIOs are also configurable for waking up the device from sleep based on an interrupt input.

The user has the ability to configure buttons, outputs, and parameters, through specific commands sent to the I<sup>2</sup>C port. The IOs have the flexibility in mapping to capacitive buttons and as standard GPIO functions such as interrupt output or input, LED drive and digital mapping of input to output using simple logical operations. This enables easy PCB trace routing and reduces the PCB size and stack up. CapSense Express products are designed for easy integration into complex products.

## Architecture

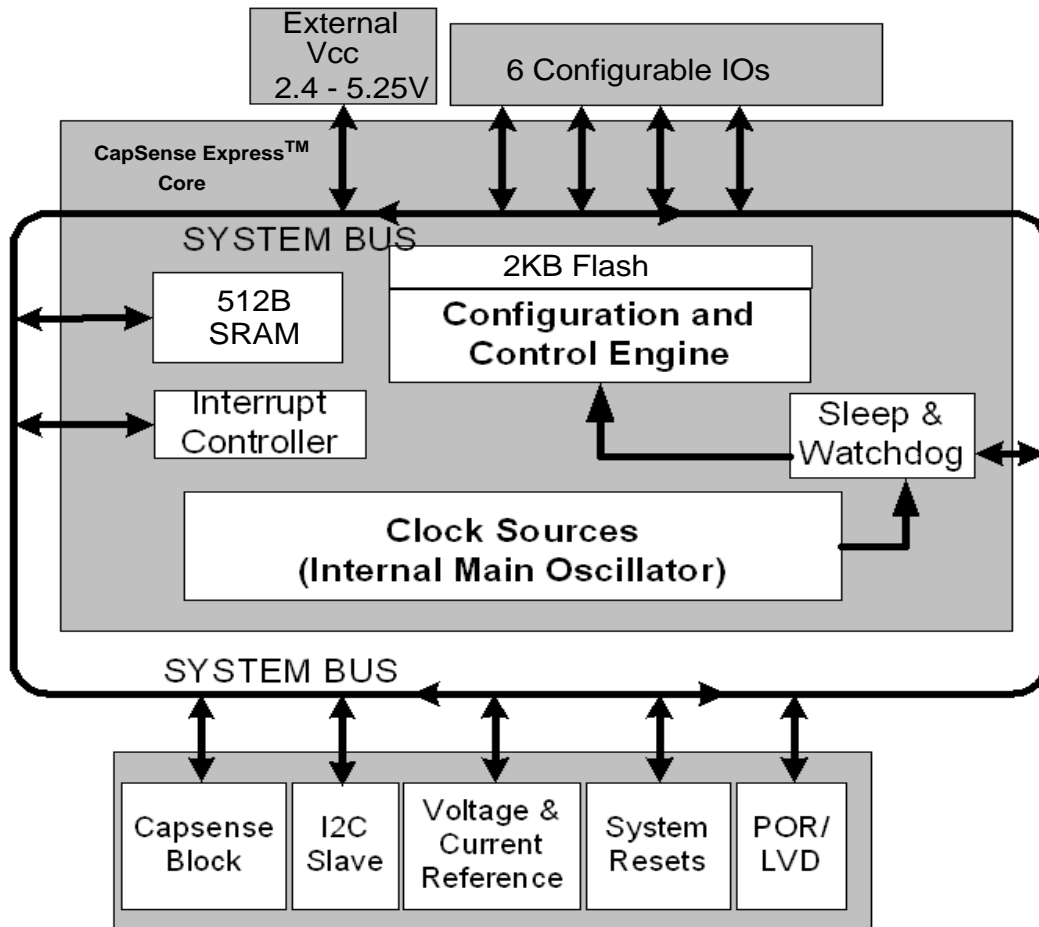

The logic block diagram shows the internal architecture of CY8C20160.

The user can configure registers with parameters needed to adjust the operation and sensitivity of the CapSense system. CY8C20160 supports a standard I<sup>2</sup>C serial communication interface that allows the host to configure the device and to read sensor information in real time through easy register access.

## The CapSense Express Core

The CapSense Express Core has a powerful configuration and control block. It encompasses SRAM for data storage, an interrupt controller, sleep, and watchdog timers. System resources provide additional capability, such as a configurable I<sup>2</sup>C slave communication interface and various system resets. The Analog System is composed of the CapSense PSoC block which supports capacitive sensing of up to six inputs.

## The CapSense Analog System

The CapSense analog system contains the capacitive sensing hardware which supports CapSense Successive Approximation (CSA) algorithm. This hardware performs capacitive sensing and scanning without external components. Capacitive sensing is configurable on each pin.

## Additional System Resources

System Resources provide additional capability useful to complete systems. Additional resources are low voltage detection and Power On Reset (POR).

- The I<sup>2</sup>C slave provides 50, 100, or 400 kHz communication over two wires.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels and the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.

An internal 1.8V reference provides a stable internal reference so that capacitive sensing functionality is not affected by minor V<sub>DD</sub> changes.

## I<sup>2</sup>C Interface

The two modes of operation for the I<sup>2</sup>C interface are:

- Device register configuration and status read or write for controller
- Command execution

The I<sup>2</sup>C address is programmable during configuration. It can be locked to prevent accidental change by setting a flag in a configuration register.

## CapSense Express Software Tool

An easy to use software tool integrated with PSoC Express is available for configuring and tuning CapSense Express devices. Refer to the Application Note [AN42137](#) for details of the software tool.

## CapSense Express Register Map

CapSense Express supports user configurable registers through which the device functionality and parameters are configured. For details, refer to [CY8C201xx Register Reference](#) document.

## Electrical Specifications

### Absolute Maximum Ratings

Parameter	Description	Min	Typ	Max	Unit	Notes
T <sub>STG</sub>	Storage temperature	−55	25	+100	°C	Higher storage temperatures reduce data retention time. Recommended storage temperature is +25°C ± 25°C (0°C to 50°C). Extended duration storage temperatures above 65°C degrade reliability.
T <sub>A</sub>	Ambient temperature with power applied	−40	−	+85	°C
