

# 3823 Group

## SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

REJ03B0146-0202  
Rev.2.02  
Jun.19.2007

### DESCRIPTION

The 3823 group is the 8-bit microcomputer based on the 740 family core technology.

The 3823 group has the LCD drive control circuit, an 8-channel A/D converter, a serial interface, a watchdog timer, a ROM correction function, and as additional functions.

The various microcomputers in the 3823 group include variations of internal memory size and packaging. For details, refer to the section on part numbering.

### FEATURES

- Basic machine-language instructions ..... 71
- The minimum instruction execution time ..... 0.4  $\mu$ s  
(at  $f(XIN) = 10$  MHz, High-speed mode)
- Memory size
  - ROM ..... 16 K to 60 K bytes
  - RAM ..... 640 to 2560 bytes
- ROM correction function ..... 32 bytes  $\times$  2 blocks
- Watchdog timer ..... 8-bit  $\times$  1
- Programmable input/output ports ..... 49
- Input ports ..... 5
- Software pull-up/pull-down resistors (Ports P0-P7 except port P40)
- Interrupts ..... 17 sources, 16 vectors  
(includes key input interrupt)
- Key Input Interrupt (Key-on Wake-Up) ..... 8
- Timers ..... 8-bit  $\times$  3, 16-bit  $\times$  2
- Serial interface ..... 8-bit  $\times$  1 (UART or Clock-synchronized)
- A/D converter ..... 10-bit  $\times$  8 channels or 8-bit  $\times$  8 channels

### ● LCD drive control circuit

- Bias ..... 1/2, 1/3
- Duty ..... 1/2, 1/3, 1/4
- Common output ..... 4
- Segment output ..... 32

### ● Main clock generating circuits ..... Built-in feedback resistor (connect to external ceramic resonator or quartz-crystal oscillator)

### ● Sub-clock generating circuits

(connect to external quartz-crystal oscillator or on-chip oscillator)

### ● Power source voltage

- In frequency/2 mode ( $f(XIN) \leq 10$  MHz) ..... 4.5 to 5.5 V
- In frequency/2 mode ( $f(XIN) \leq 8$  MHz) ..... 4.0 to 5.5 V
- In frequency/4 mode ( $f(XIN) \leq 10$  MHz) ..... 2.5 to 5.5 V
- In frequency/4 mode ( $f(XIN) \leq 8$  MHz) ..... 2.0 to 5.5 V
- In frequency/4 mode ( $f(XIN) \leq 5$  MHz) ..... 1.8 to 5.5 V
- In frequency/8 mode ( $f(XIN) \leq 10$  MHz) ..... 2.5 to 5.5 V
- In frequency/8 mode ( $f(XIN) \leq 8$  MHz) ..... 2.0 to 5.5 V
- In frequency/8 mode ( $f(XIN) \leq 5$  MHz) ..... 1.8 to 5.5 V
- In low-speed mode ..... 1.8 to 5.5 V

### ● Power dissipation

- In frequency/2 mode ..... 18 mW (std.)  
(at  $f(XIN) = 8$  MHz,  $V_{CC} = 5$  V,  $T_a = 25^\circ\text{C}$ )
- In low-speed mode at  $X_{CIN}$  ..... 18  $\mu$ W (std.)  
(at  $f(XIN)$  stopped,  $f(X_{CIN}) = 32$  kHz,  $V_{CC} = 2.5$  V,  $T_a = 25^\circ\text{C}$ )
- In low-speed mode at on-chip oscillator ..... 35  $\mu$ W (std.)  
(at  $f(XIN)$  stopped,  $f(X_{CIN}) =$  stopped,  $V_{CC} = 2.5$  V,  $T_a = 25^\circ\text{C}$ )

### ● Operating temperature range ..... - 20 to 85 $^\circ\text{C}$

### APPLICATIONS

Camera, audio equipment, household appliances, consumer electronics, etc.

Fig. 1 M3823XGX-XXXFP pin configuration

Fig. 2 M3823XGX-XXXHP pin configuration

**Table 1 Performance overview**

Parameter		Function
Number of basic instructions		71
Instruction execution time		0.4 $\mu$ s (Minimum instruction, f(XIN) 10 MHz, High-speed mode)
Oscillation frequency		10 MHz (Maximum)
Memory sizes	ROM	16 K to 60 K bytes
	RAM	640 to 2560 bytes
Input port	P34-P37, P40	4-bit $\times$ 1, 1-bit $\times$ 1 (4 pins sharing SEG)
I/O port	P0-P2, P41-P47, P5, P6, P70, P71	8-bit $\times$ 5, 7-bit $\times$ 1, 2 bit $\times$ 1 (16 pins sharing SEG)
Interrupt		17 sources, 16 vectors (includes key input interrupt)
Timer		8-bit $\times$ 3, 16-bit $\times$ 2
Serial interface		8-bit $\times$ 1 (UART or Clock-synchronized)
A/D converter		10-bit $\times$ 8 channels or 8 bit $\times$ 8 channels
Watchdog timer		8-bit $\times$ 1
ROM correction function		32 bytes $\times$ 2 blocks
LCD drive control circuit	Bias	1/2, 1/3
	Duty	2, 3, 4
	Common output	4
	Segment output	32
Main clock generating circuits		Built-in feedback resistor (connect to external ceramic resonator or quartz-crystal oscillator)
Sub-clock generating circuits		Built-in feedback resistor (connect to external quartz-crystal oscillator or on-chip oscillator)
Power source voltage	In frequency/2 mode (f(XIN) $\leq$ 10MHz)	4.5 to 5.5V
	In frequency/2 mode (f(XIN) $\leq$ 8MHz)	4.0 to 5.5V
	In frequency/4 mode (f(XIN) $\leq$ 10MHz)	2.5 to 5.5V
	In frequency/4 mode (f(XIN) $\leq$ 8MHz)	2.0 to 5.5V
	In frequency/4 mode (f(XIN) $\leq$ 5MHz)	1.8 to 5.5V
	In frequency/8 mode (f(XIN) $\leq$ 10MHz)	2.5 to 5.5V
	In frequency/8 mode (f(XIN) $\leq$ 8MHz)	2.0 to 5.5V
	In frequency/8 mode (f(XIN) $\leq$ 5MHz)	1.8 to 5.5V
	In low-speed mode	1.8 to 5.5V
Power dissipation	In frequency/2 mode	Std. 18 mW (Vcc = 5V, f(XIN) = 8MHz, Ta = 25 °C)
	In low-speed mode at XCIN	Std. 18 $\mu$ W (Vcc = 2.5V, f(XIN) = stopped, f(XCIN) = 32kHz, Ta = 25 °C)
	In low-speed mode at on-chip oscillator	Std. 35 $\mu$ W (Vcc = 2.5V, f(XIN) = stopped, f(XCIN) = stopped, Ta = 25 °C)
Input/Output characteristics	Input/Output withstand voltage	Vcc
	Output current	10mA
Operating temperature range		-20 to 85 °C
Device structure		CMOS silicon gate
Package		80-pin plastic molded LQFP/QFP

FUNCTIONAL BLOCK DIAGRAM (Package type : PLQP0080KB-A)

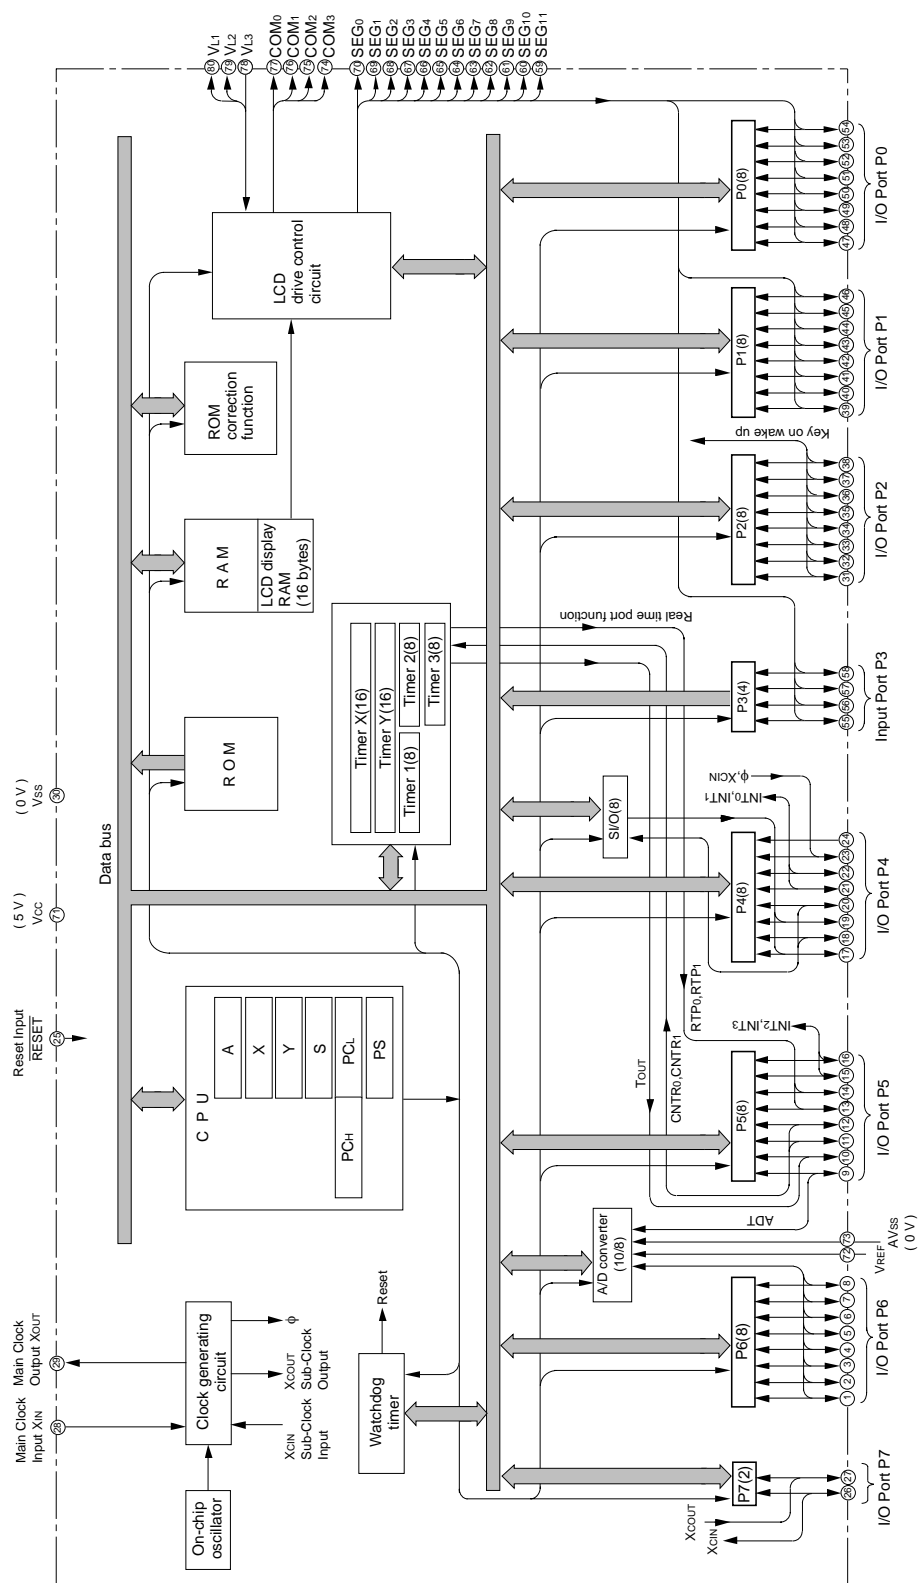

Fig. 3 Functional block diagram

## PIN DESCRIPTION

Table 2 Pin description (1)

Pin	Name	Function	
			Function except a port function
VCC, VSS	Power source	<ul style="list-style-type: none"> <li>•Apply voltage of power source to VCC, and 0 V to VSS. (For the limits of VCC, refer to "Recommended operating conditions").</li> </ul>	
VREF	Analog reference voltage	<ul style="list-style-type: none"> <li>•Reference voltage input pin for A/D converter.</li> </ul>	
AVSS	Analog power source	<ul style="list-style-type: none"> <li>•GND input pin for A/D converter.</li> <li>•Connect to VSS.</li> </ul>	
RESET	Reset input	<ul style="list-style-type: none"> <li>•Reset input pin for active "L".</li> </ul>	
XIN	Clock input	<ul style="list-style-type: none"> <li>•Input and output pins for the main clock generating circuit.</li> <li>•Feedback resistor is built in between XIN pin and XOUT pin.</li> </ul>	
XOUT	Clock output	<ul style="list-style-type: none"> <li>•Connect a ceramic resonator or a quartz-crystal oscillator between the XIN and XOUT pins to set the oscillation frequency.</li> <li>•If an external clock is used, connect the clock source to the XIN pin and leave the XOUT pin open.</li> <li>•This clock is used as the oscillating source of system clock.</li> </ul>	
VL1–VL3	LCD power source	<ul style="list-style-type: none"> <li>•Input <math>0 \leq VL1 \leq VL2 \leq VL3</math> voltage.</li> <li>•Input <math>0 - VL3</math> voltage to LCD.</li> </ul>	
COM0–COM3	Common output	<ul style="list-style-type: none"> <li>•LCD common output pins.</li> <li>•COM2 and COM3 are not used at 1/2 duty ratio.</li> <li>•COM3 is not used at 1/3 duty ratio.</li> </ul>	
SEG0–SEG11	Segment output	<ul style="list-style-type: none"> <li>•LCD segment output pins.</li> </ul>	
P00/SEG16–P07/SEG23	I/O port P0	<ul style="list-style-type: none"> <li>•8-bit I/O port.</li> <li>•CMOS compatible input level.</li> <li>•CMOS 3-state output structure.</li> </ul>	<ul style="list-style-type: none"> <li>•LCD segment output pins</li> </ul>
P10/SEG24–P17/SEG31	I/O port P1	<ul style="list-style-type: none"> <li>•I/O direction register allows each port to be individually programmed as either input or output.</li> <li>•Pull-down control is enabled.</li> </ul>	
P20/KW0 – P27/KW7	I/O port P2	<ul style="list-style-type: none"> <li>•8-bit I/O port.</li> <li>•CMOS compatible input level.</li> <li>•CMOS 3-state output structure.</li> <li>•I/O direction register allows each pin to be individually programmed as either input or output.</li> <li>•Pull-up control is enabled.</li> </ul>	<ul style="list-style-type: none"> <li>•Key input (key-on wake-up) interrupt input pins</li> </ul>

P70/XCOUT, P71/XCIN	I/O port P7	<ul style="list-style-type: none"> <li>•2-bit I/O port.</li> <li>•CMOS compatible input level.</li> <li>•CMOS 3-state output structure.</li> <li>•I/O direction register allows each pin to be individually programmed as either input or output.</li> <li>•Pull-up control is enabled.</li> </ul>	<ul style="list-style-type: none"> <li>•Sub-clock generating circuit I/O pins. (Connect a resonator. External clock cannot be used.)</li> </ul>

## PART NUMBERING

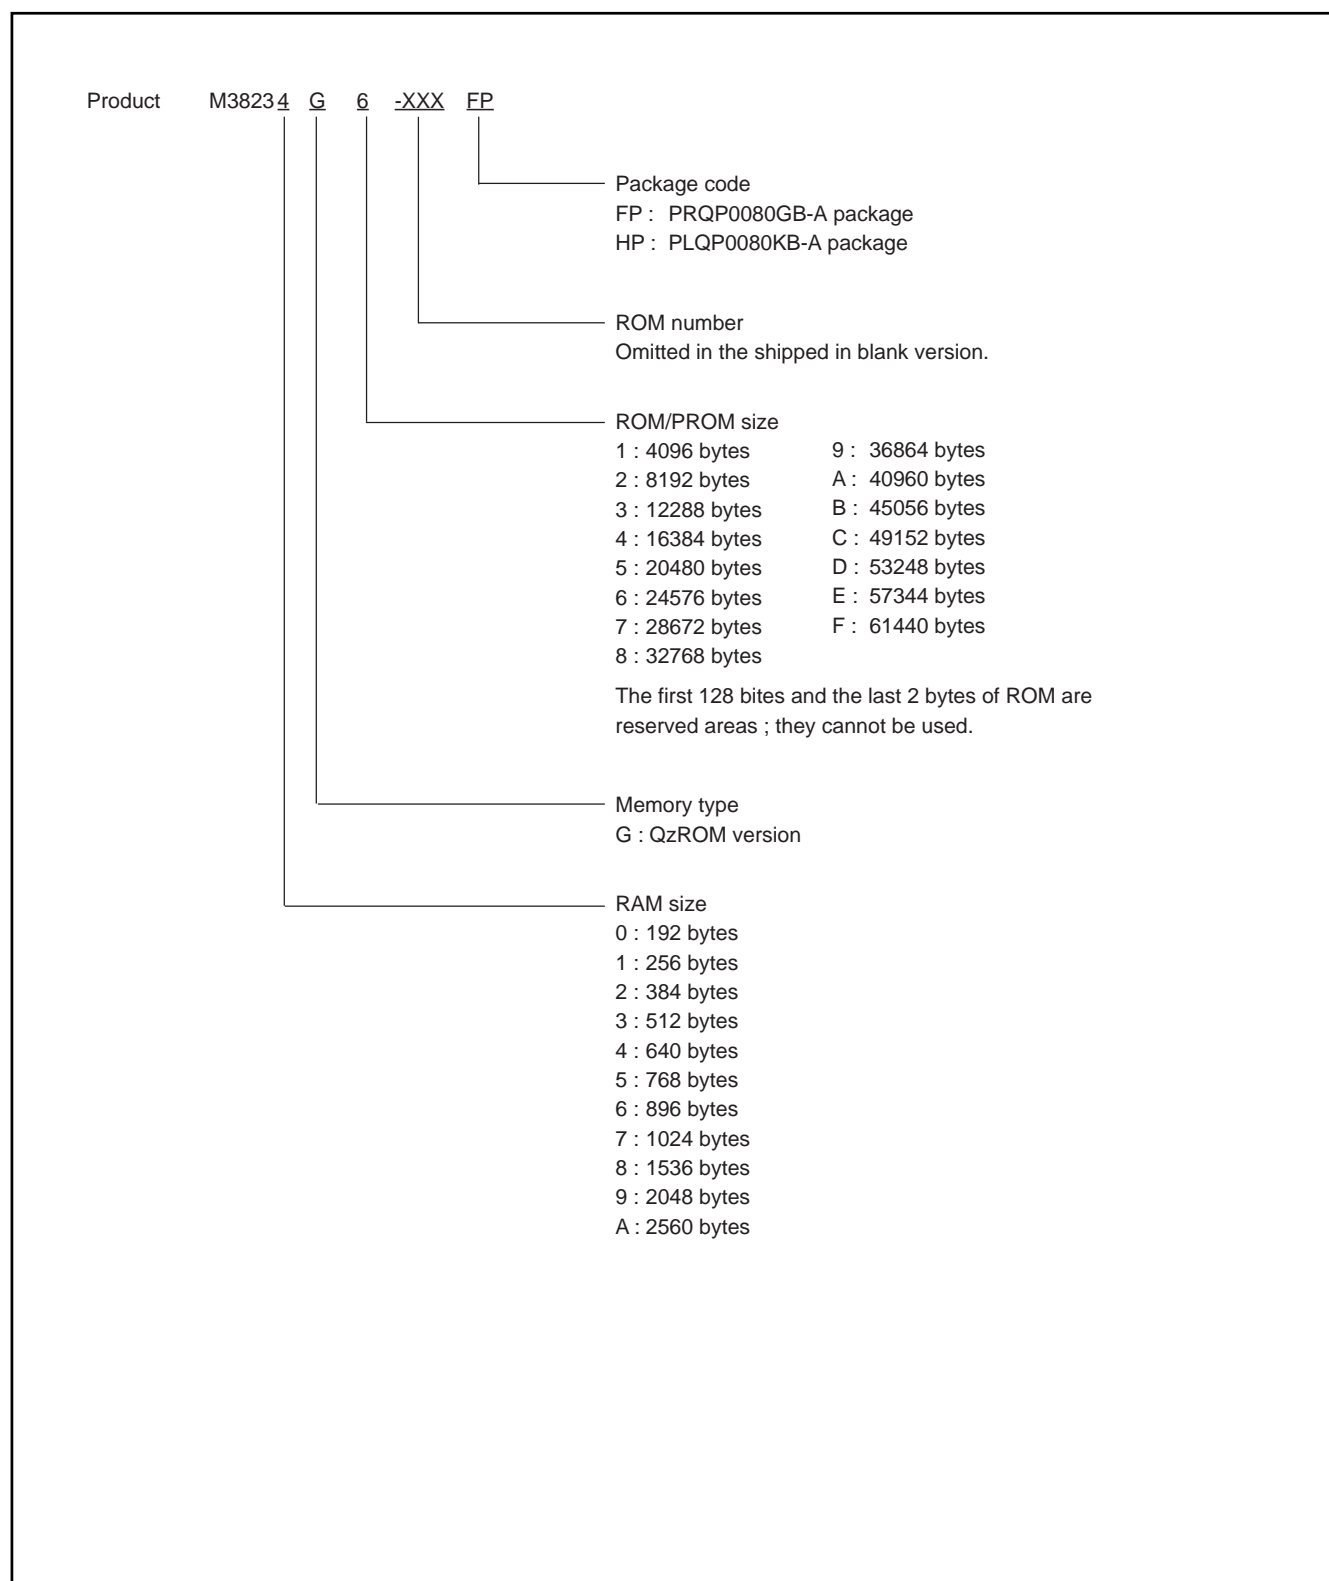

Fig. 4 Part numbering

## GROUP EXPANSION

Mitsubishi plans to expand the 3823 group as follows:

## Memory Type

Support for QzROM version.

## Memory Size

ROM size ..... 16 K to 60 K bytes

RAM size ..... 640 to 2560 bytes

## Package

PRQP0080GB-A ..... 0.8 mm-pitch plastic molded QFP

PLQP0080KB-A ..... 0.5 mm-pitch plastic molded LQFP

## Memory Expansion Plan

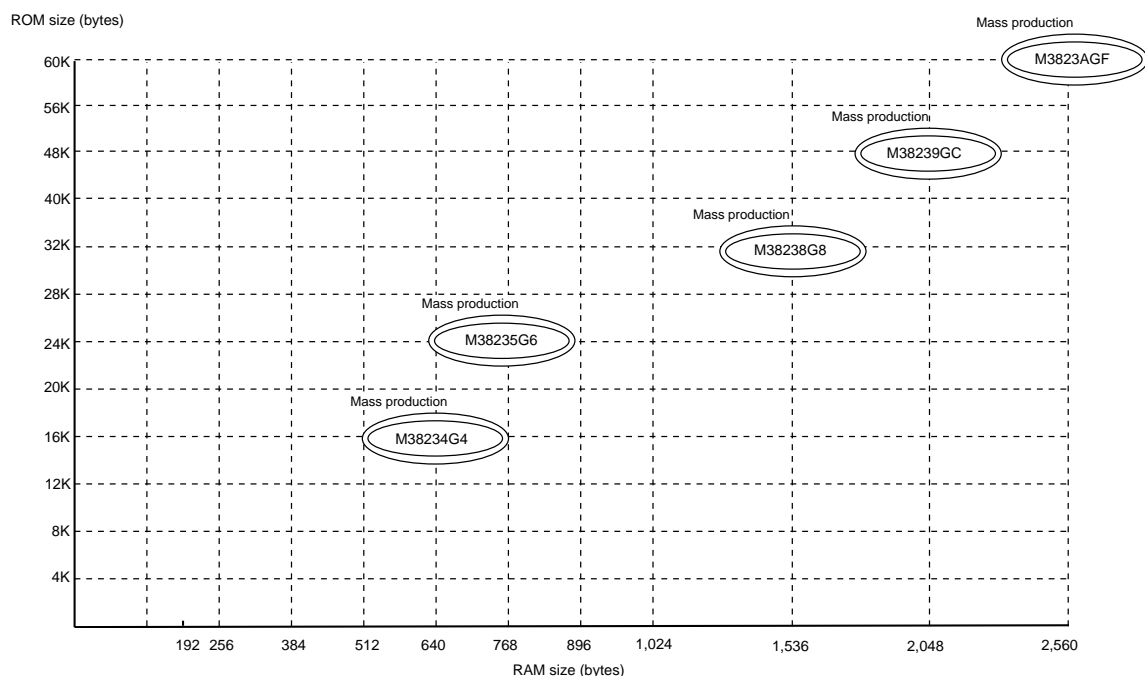

Fig. 5 Memory expansion plan

Currently products are listed below.

**Table 4 List of products**

Part No.	ROM size (bytes) ROM size for User in ( )	RAM size (bytes)	Package	Remarks
M3823AGF-XXXFP	61440 (61310)	2560 <b>(Note 1)</b>	PRQP0080GB-A	
M3823AGF-XXXHP			PLQP0080KB-A	
M3823AGFFP			PRQP0080GB-A	Blank

M38234G4-XXXFP	16384 (16254)	640 <b>(Note 2)</b>	PRQP0080GB-A	
M38234G4-XXXHP			PLQP0080KB-A	
M38234G4FP			PRQP0080GB-A	Blank
M38234G4HP			PLQP0080KB-A	Blank

**Note 1:** RAM size includes RAM for LCD display and ROM corrections.

**Note 2:** RAM size includes RAM for LCD display.

## FUNCTIONAL DESCRIPTION

### CENTRAL PROCESSING UNIT (CPU)

The 3823 group uses the standard 740 family instruction set. Refer to the table of 740 family addressing modes and machine instructions or the 740 Family Software Manual for details on the instruction set.

Machine-resident 740 family instructions are as follows:

The FST and SLW instruction cannot be used.

The STP, WIT, MUL, and DIV instruction can be used.

The central processing unit (CPU) has six registers. Figure 6 shows the 740 Family CPU register structure.

#### [Accumulator (A)]

The accumulator is an 8-bit register. Data operations such as data transfer, etc., are executed mainly through the accumulator.

#### [Index Register X (X)]

The index register X is an 8-bit register. In the index addressing modes, the value of the OPERAND is added to the contents of register X and specifies the real address.

#### [Index Register Y (Y)]

The index register Y is an 8-bit register. In partial instruction, the value of the OPERAND is added to the contents of register Y and specifies the real address.

#### [Stack Pointer (S)]

The stack pointer is an 8-bit register used during subroutine calls and interrupts. This register indicates start address of stored area (stack) for storing registers during subroutine calls and interrupts.

The low-order 8 bits of the stack address are determined by the contents of the stack pointer. The high-order 8 bits of the stack address are determined by the stack page selection bit. If the stack page selection bit is "0", the high-order 8 bits becomes "0016". If the stack page selection bit is "1", the high-order 8 bits becomes "0116".

The operations of pushing register contents onto the stack and popping them from the stack are shown in Figure 7.

Store registers other than those described in Table 4 with program when the user needs them during interrupts or subroutine calls.

#### [Program Counter (PC)]

The program counter is a 16-bit counter consisting of two 8-bit registers PCH and PCL. It is used to indicate the address of the next instruction to be executed.

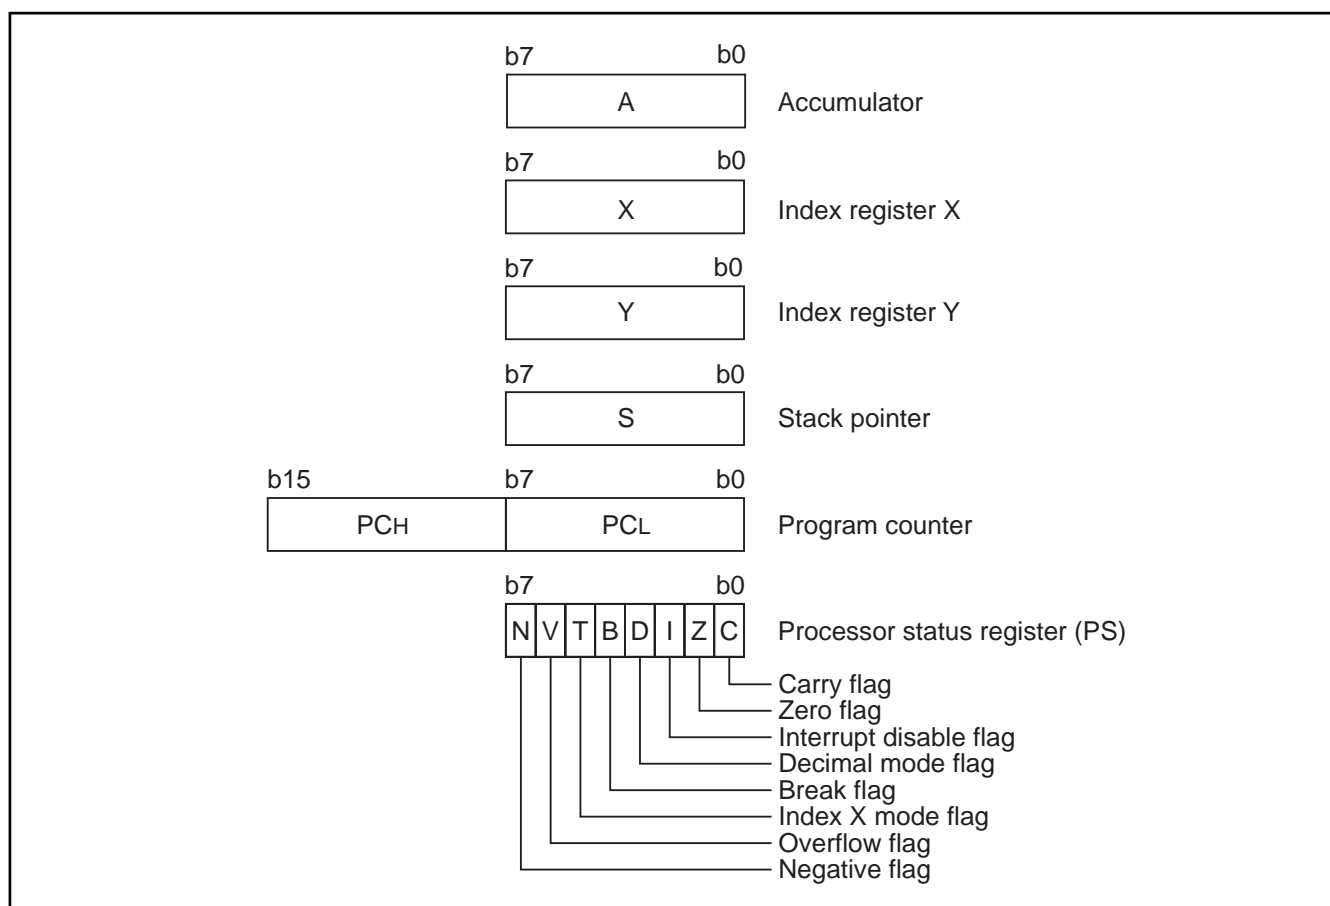

Fig. 6 740 Family CPU register structure

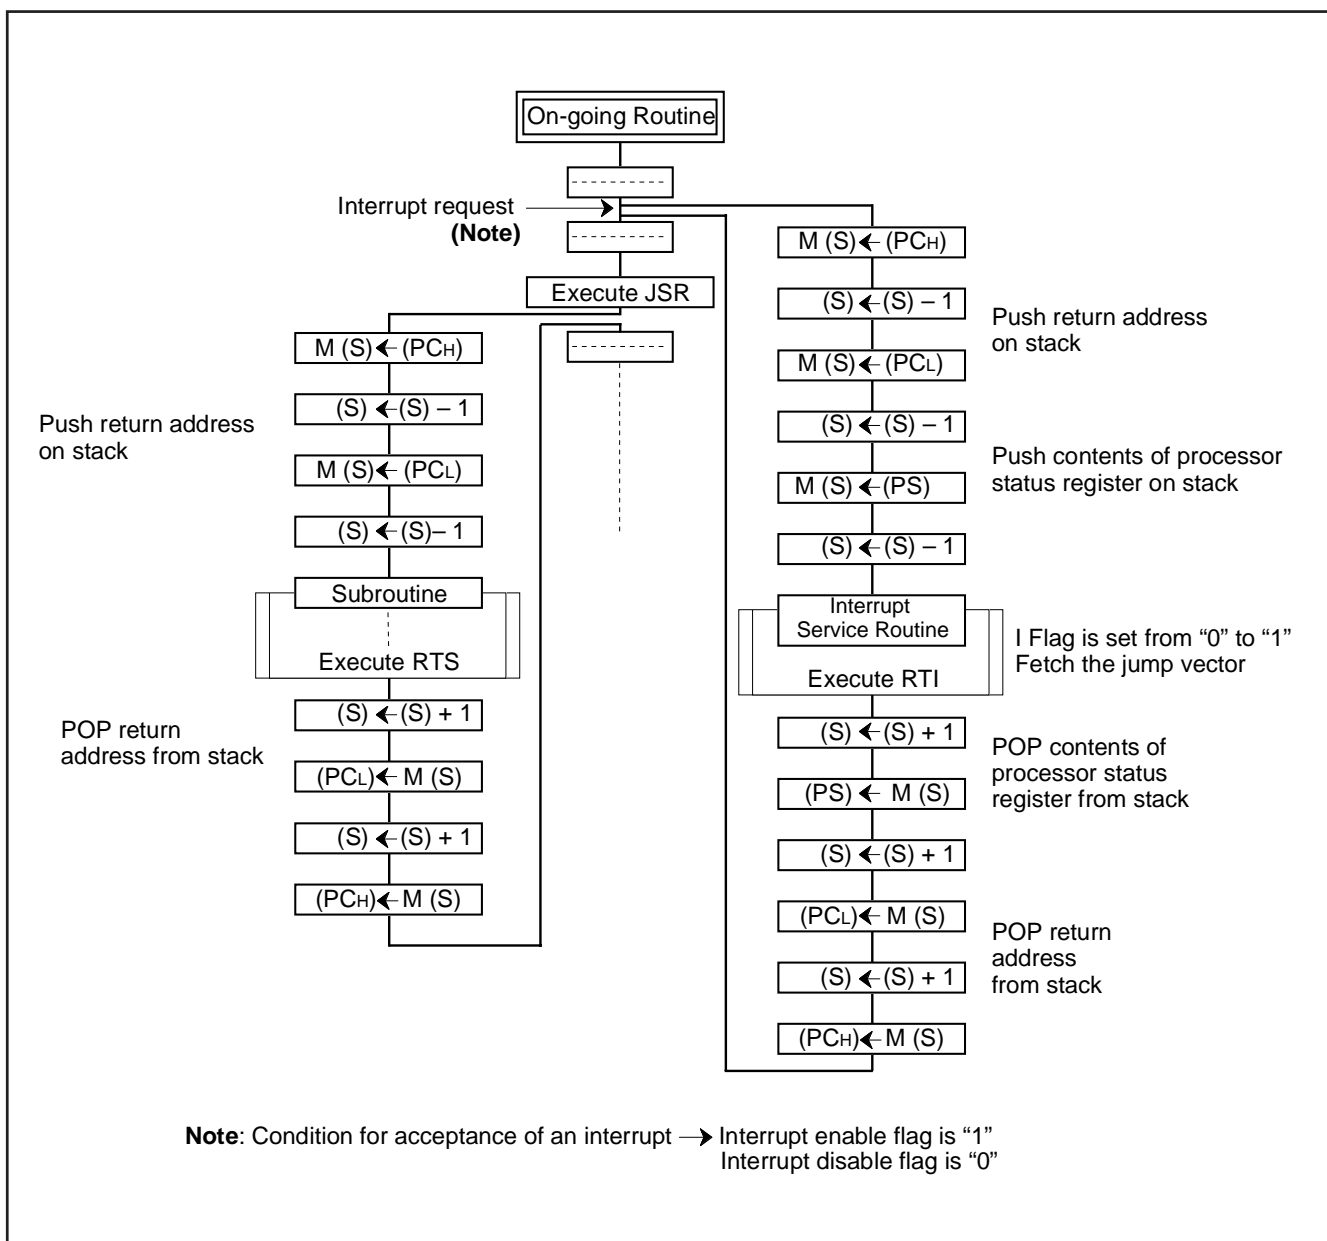

Fig. 7 Register push and pop at interrupt generation and subroutine call

Table 5 Push and pop instructions of accumulator or processor status register

	Push instruction to stack	Pop instruction from stack
Accumulator	PHA	PLA
Processor status register	PHP	PLP

## [Processor status register (PS)]

The processor status register is an 8-bit register consisting of 5 flags which indicate the status of the processor after an arithmetic operation and 3 flags which decide MCU operation. Branch operations can be performed by testing the Carry (C) flag, Zero (Z) flag, Overflow (V) flag, or the Negative (N) flag. In decimal mode, the Z, V, N flags are not valid.

•Bit 0: Carry flag (C)

The C flag contains a carry or borrow generated by the arithmetic logic unit (ALU) immediately after an arithmetic operation. It can also be changed by a shift or rotate instruction.

•Bit 1: Zero flag (Z)

The Z flag is set if the result of an immediate arithmetic operation or a data transfer is "0", and cleared if the result is anything other than "0".

•Bit 2: Interrupt disable flag (I)

The I flag disables all interrupts except for the interrupt generated by the BRK instruction.

Interrupts are disabled when the I flag is "1".

•Bit 3: Decimal mode flag (D)

The D flag determines whether additions and subtractions are executed in binary or decimal. Binary arithmetic is executed when this flag is "0"; decimal arithmetic is executed when it is "1".

Decimal correction is automatic in decimal mode. Only the ADC and SBC instructions can be used for decimal arithmetic.

•Bit 4: Break flag (B)

The B flag is used to indicate that the current interrupt was generated by the BRK instruction. The BRK flag in the processor status register is always "0". When the BRK instruction is used to generate an interrupt, the processor status register is pushed onto the stack with the break flag set to "1".

•Bit 5: Index X mode flag (T)

When the T flag is "0", arithmetic operations are performed between accumulator and memory. When the T flag is "1", direct arithmetic operations and direct data transfers are enabled between memory locations.

•Bit 6: Overflow flag (V)

The V flag is used during the addition or subtraction of one byte of signed data. It is set if the result exceeds +127 to -128. When the BIT instruction is executed, bit 6 of the memory location operated on by the BIT instruction is stored in the overflow flag.

•Bit 7: Negative flag (N)

The N flag is set if the result of an arithmetic operation or data transfer is negative. When the BIT instruction is executed, bit 7 of the memory location operated on by the BIT instruction is stored in the negative flag.

**Table 6 Set and clear instructions of each bit of processor status register**

	C flag	Z flag	I flag	D flag	B flag	T flag	V flag	N flag
Set instruction	SEC	–	SEI	SED	–	SET	–	–
Clear instruction	CLC	–	CLI	CLD	–	CLT	CLV	–

### [CPU Mode Register (CPUM)] 003B16

The CPU mode register contains the stack page selection bit and the internal system clock selection bit.

The CPU mode register is allocated at address 003B16.

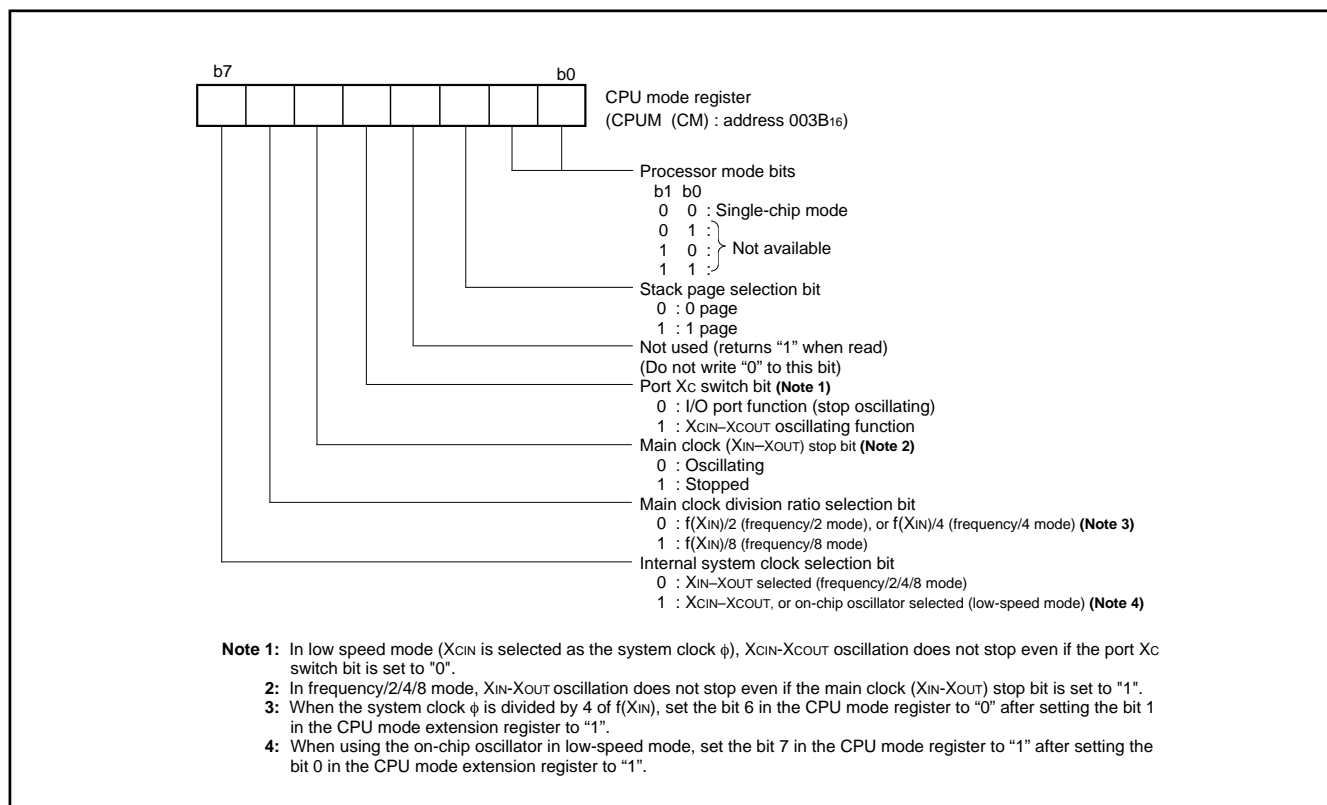

Fig. 8 Structure of CPU mode register

### [CPU Mode Extension Register (EXPCM)] 002B16

$f(XIN)$  divided by 4 for the system clock  $f$  and the on-chip oscillator for the system clock  $f$  in low-speed mode can be selected by setting the CPU mode extension register. When the system clock  $f$  is divided by 4 of  $f(XIN)$ , set the bit 6 in the CPU mode register to "0" after setting the bit 1 in the CPU mode extension register to "1". When using the on-chip oscillator in low-speed mode, set the bit 7 in the CPU mode register to "1" after setting the bit 0 in the CPU mode extension register to "1".

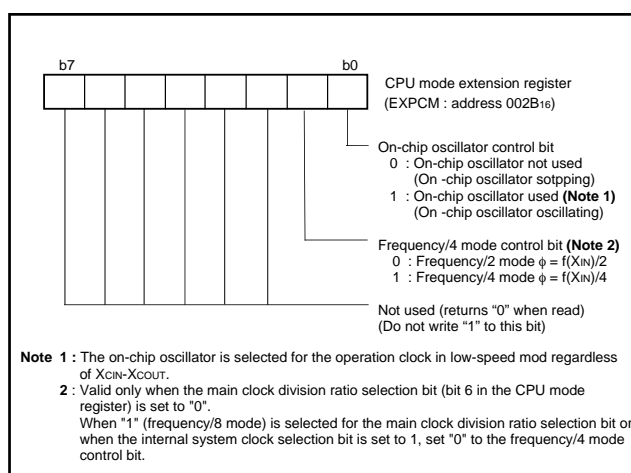

Fig. 9 Structure of CPU mode extension register

## MEMORY

### Special Function Register (SFR) Area

The Special Function Register area in the zero page contains control registers such as I/O ports and timers.

### RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

### ROM

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing and the rest is user area for storing programs.

### Interrupt Vector Area

The interrupt vector area contains reset and interrupt vectors.

### Zero Page

The 256 bytes from addresses 0000<sub>16</sub> to 00FF<sub>16</sub> are called the zero page area. The internal RAM and the special function register (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

### Special Page

The 256 bytes from addresses FF00<sub>16</sub> to FFFF<sub>16</sub> are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

### ROM Code Protect Address

"00<sub>16</sub>" is written into ROM code protect address (other than the user ROM area) when selecting the protect bit write by using a serial programmer or selecting protect enabled for writing shipment by Renesas Technology corp.. When "00<sub>16</sub>" is set to the ROM code protect address, the protect function is enabled, so that reading or writing from/to QzROM is disabled by a serial programmer.

As for the QzROM product in blank, the ROM code is protected by selecting the protect bit write at ROM writing with a serial programmer.

As for the QzROM product shipped after writing, "00<sub>16</sub>" (protect enabled) or "FF<sub>16</sub>" (protect disabled) is written into the ROM code protect address when Renesas Technology corp. performs writing. The writing of "00<sub>16</sub>" or "FF<sub>16</sub>" can be selected as ROM option setup ("MASK option" written in the mask file converter) when ordering.

Fig. 11 Memory map of special function register (SFR)

## I/O PORTS

### Direction Registers (ports P2, P41-P47, and P5-P7)

The 3823 group has 49 programmable I/O pins arranged in seven I/O ports (ports P0-P2, P41-P47 and P5-P7). The I/O ports P2, P41-P47 and P5-P7 have direction registers which determine the input/output direction of each individual pin. Each bit in a direction register corresponds to one pin, and each pin can be set to be input port or output port.

When "0" is written to the bit corresponding to a pin, that pin becomes an input pin. When "1" is written to that bit, that pin becomes an output pin.

If data is read from a pin set to output, the value of the port output latch is read, not the value of the pin itself. Pins set to input are floating. If a pin set to input is written to, only the port output latch is written to and the pin remains floating.

### Direction Registers (ports P0 and P1)

Ports P0 and P1 have direction registers which determine the input/output direction of each individual port.

Each port in a direction register corresponds to one port, each port can be set to be input or output. When "0" is written to the bit 0 of a direction register, that port becomes an input port. When "1" is written to that port, that port becomes an output port. Bits 1 to 7 of ports P0 and P1 direction registers are not used.

### Ports P3 and P40

These ports are only for input.

### Pull-up/Pull-down Control

By setting the PULL register A (address 0016<sub>16</sub>) or the PULL register B (address 0017<sub>16</sub>), ports except for port P40 can control either pull-down or pull-up (pins that are shared with the segment output pins for LCD are pull-down; all other pins are pull-up) with a program.

However, the contents of PULL register A and PULL register B do not affect ports programmed as the output ports.

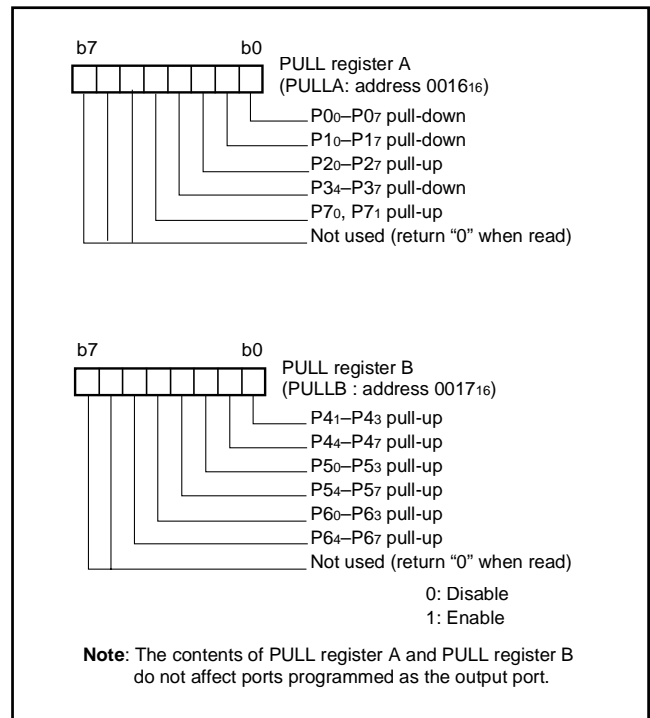

Fig. 12 Structure of PULL register A and PULL register B

Table 7 List of I/O port function

Pin	Name	Input/Output	I/O Format	Non-Port Function	Related SFRs	Diagram No.
P00/SEG16– P07/SEG23	Port P0	Input/output, individual ports	CMOS compatible input level CMOS 3-state output	LCD segment output	PULL register A Segment output enable register	(1)

**Notes 1:** For details of how to use double function ports as function I/O ports, refer to the applicable sections.

**2:** When an input level is at an intermediate potential, a current will flow from Vcc to Vss through the input-stage gate.

Especially, power source current may increase during execution of the STP and WIT instructions.

Fix the unused input pins to "H" or "L" through a resistor.

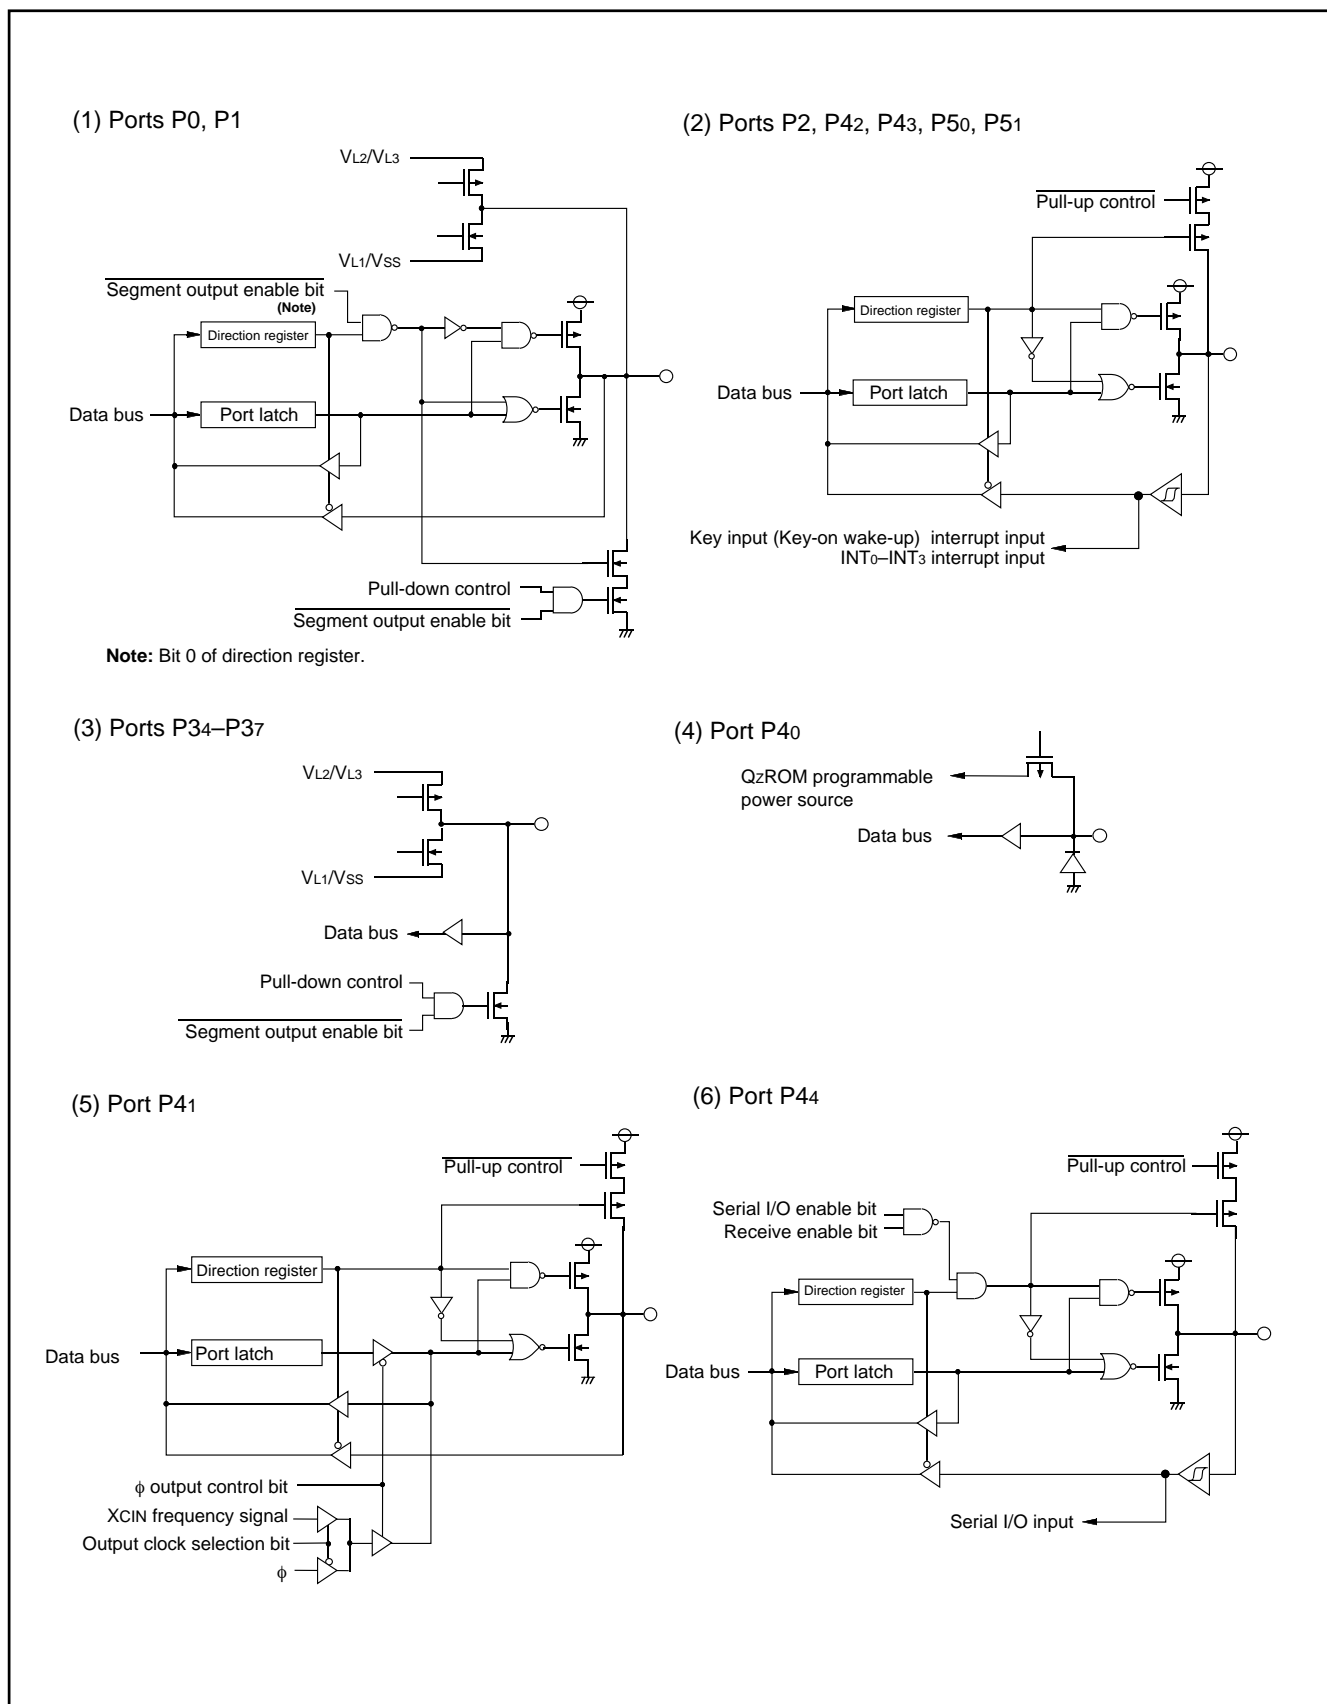

Fig. 13 Port block diagram (1)

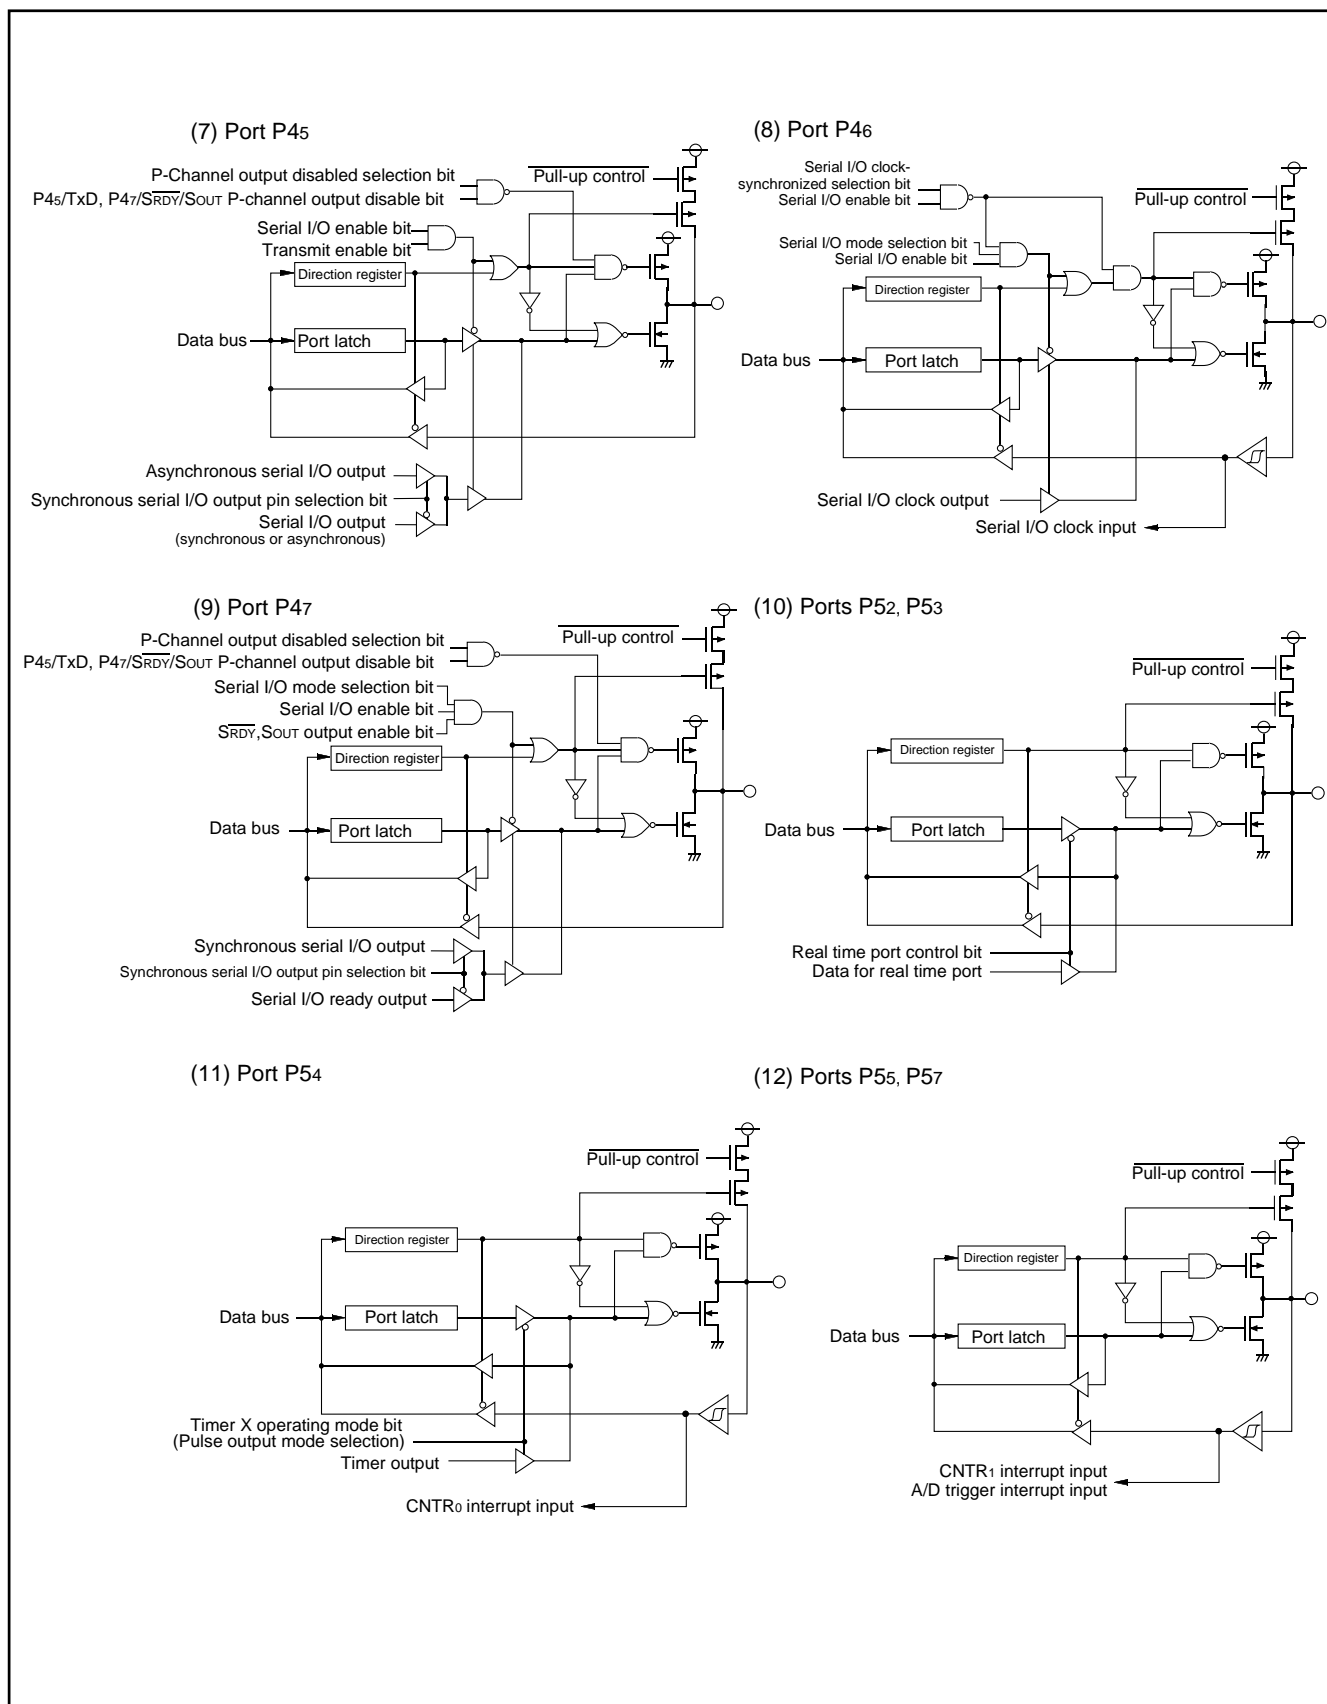

Fig. 14 Port block diagram (2)

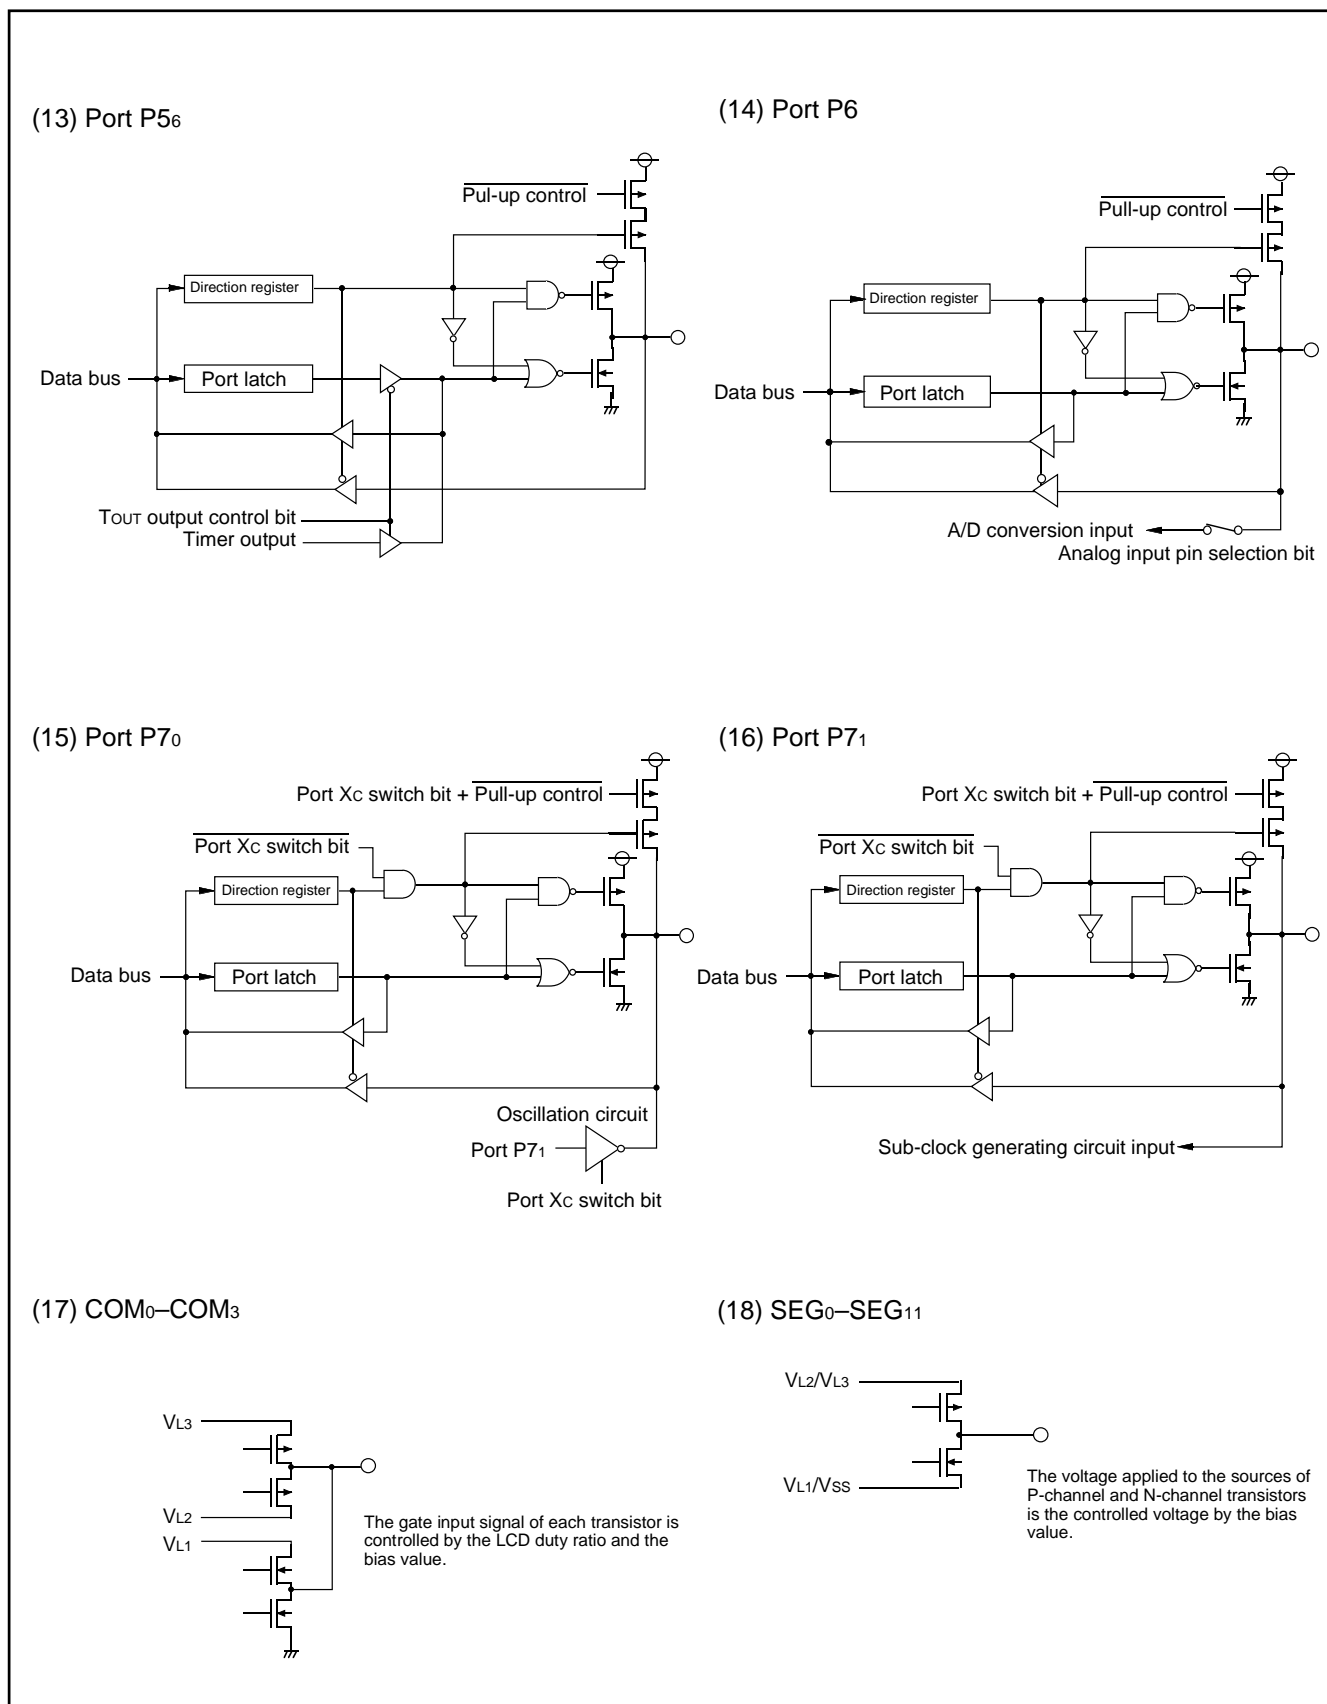

Fig. 15 Port block diagram (3)

## Termination of unused pins

- Termination of common pins

I/O ports: Select an input port or an output port and follow each processing method.

Output ports: Open.

Input ports: If the input level become unstable, through current flow to an input circuit, and the power supply current may increase.

Especially, when expecting low consumption current (at STP or WIT instruction execution etc.), pull-up or pull-down input ports to prevent through current (built-in resistor can be used). Pull-down the P40/(VPP) pin.

We recommend processing unused pins through a resistor which can secure  $I_{OH(avg)}$  or  $I_{OL(avg)}$ .

Because, when an I/O port or a pin which have an output function is selected as an input port, it may operate as an output port by incorrect operation etc.

Table 8 Termination of unused pins

Pin	Termination 1 (recommend)	Termination 2	Termination 3
P00/SEG16–P17/SEG23	I/O port	When selecting SEG output, open.	–
P10/SEG24–P17/SEG31			
P20/KW0–P27/KW7		When selecting KW function, perform termination of input port.	–
P34/SEG12–P37/SEG15	Input port	When selecting SEG output, open.	–
P40/(VPP)	Input port (pull-down)	–	–
P41/ $\phi$	I/O port	When selecting $\phi$ output, open.	–
P42/INT0		When selecting INT0 function, perform termination of input port.	–
P43/INT1		When selecting INT1 function, perform termination of input port.	–
P44/RxD		When selecting RxD function, perform termination of input port.	–
P45/TxD		When selecting TxD function, perform termination of output port.	–
P46/SCLK		When selecting external clock input, perform termination of input port.	When selecting internal clock output, perform termination of output port.
P47/ $\overline{\text{SRDY}}$ /SOUT		When selecting $\overline{\text{SRDY}}$ function, perform termination of output port.	When selecting SOUT function, perform termination of output port.
P50/INT2		When selecting INT2 function, perform termination of input port.	–
P51/INT3		When selecting INT3 function, perform termination of input port.	–
P52/RTP0		When selecting RTP0 function, perform termination of output port.	–
P53/RTP1		When selecting RTP1 function, perform termination of output port.	–
P54/CNTR0		When selecting CNTR0 input function, perform termination of input port.	When selecting CNTR0 output function, perform termination of output port.
P55/CNTR1		When selecting CNTR1 function, perform termination of input port.	–
P56/TOUT		When selecting TOUT function, perform termination of output port.	–
P57/ADT		When selecting ADT function, perform termination of input port.	–
P60/AN0–P67/AN7		When selecting AN function, these pins can be opened. (A/D conversion result cannot be guaranteed.)	–
P70/XCOUT P71/XCIN		Do not select XCIN-XCOUT oscillation function by program.	–
VL3 (Note)	Connect to Vss	–	–

XOUT	When an external clock is input to the XIN pin, leave the XOUT pin open.	–	–

**Note :** The termination of VL3, VL2 and VL1 is applied when the bit 3 of the LCD mode register is "0"

## INTERRUPTS

The 3823 group interrupts are vector interrupts with a fixed priority scheme, and generated by 16 sources among 17 sources: 8 external, 8 internal, and 1 software.

The interrupt sources, vector addresses <sup>(1)</sup>, and interrupt priority are shown in Table 9.

Each interrupt except the BRK instruction interrupt has the interrupt request bit and the interrupt enable bit. These bits and the interrupt disable flag (I flag) control the acceptance of interrupt requests. Figure 16 shows an interrupt control diagram.

An interrupt requests is accepted when all of the following conditions are satisfied:

- Interrupt disable flag.....“0”
- Interrupt disable request bit .....“1”
- Interrupt enable bit.....“1”

Though the interrupt priority is determined by hardware, priority processing can be performed by software using the above bits and flag.

**Table 9 Interrupt vector addresses and priority**

Interrupt Source	Priority	Vector Addresses (Note 1)		Interrupt Request Generating Conditions	Remarks
		High	Low		
Reset (Note 2)	1	FFFD <sub>16</sub>	FFFC <sub>16</sub>	At reset	Non-maskable
INT <sub>0</sub>	2	FFFB <sub>16</sub>	FFFA <sub>16</sub>	At detection of either rising or falling edge of INT <sub>0</sub> input	External interrupt (active edge selectable)
INT <sub>1</sub>	3	FFF9 <sub>16</sub>	FFF8 <sub>16</sub>	At detection of either rising or falling edge of INT <sub>1</sub> input	External interrupt (active edge selectable)
Serial I/O reception	4	FFF7 <sub>16</sub>	FFF6 <sub>16</sub>	At completion of serial interface data reception	Valid when serial interface is selected
Serial I/O transmission	5	FFF5 <sub>16</sub>	FFF4 <sub>16</sub>	At completion of serial interface transmit shift or when transmission buffer is empty	Valid when serial interface is selected
Timer X	6	FFF3 <sub>16</sub>	FFF2 <sub>16</sub>	At timer X underflow	
Timer Y	7	FFF1 <sub>16</sub>	FFF0 <sub>16</sub>	At timer Y underflow	
Timer 2	8	FFEF <sub>16</sub>	FFEE <sub>16</sub>	At timer 2 underflow	
Timer 3	9	FFED <sub>16</sub>	FFEC <sub>16</sub>	At timer 3 underflow	
CNTR <sub>0</sub>	10	FFEB <sub>16</sub>	FFEA <sub>16</sub>	At detection of either rising or falling edge of CNTR <sub>0</sub> input	External interrupt (active edge selectable)
CNTR <sub>1</sub>	11	FFE9 <sub>16</sub>	FFE8 <sub>16</sub>	At detection of either rising or falling edge of CNTR <sub>1</sub> input	External interrupt (active edge selectable)
Timer 1	12	FFE7 <sub>16</sub>	FFE6 <sub>16</sub>	At timer 1 underflow	
INT <sub>2</sub>	13	FFE5 <sub>16</sub>	FFE4 <sub>16</sub>	At detection of either rising or falling edge of INT <sub>2</sub> input	External interrupt (active edge selectable)
INT <sub>3</sub>	14	FFE3 <sub>16</sub>	FFE2 <sub>16</sub>	At detection of either rising or falling edge of INT <sub>3</sub> input	External interrupt (active edge selectable)
Key input (Key-on wake-up)	15	FFE1 <sub>16</sub>	FFE0 <sub>16</sub>	At falling of conjunction of input level for port P2 (at input mode)	External interrupt (Valid at falling)
ADT	16	FFDF <sub>16</sub>	FFDE <sub>16</sub>	At falling of ADT input	Valid when ADT interrupt is selected, External interrupt (Valid at falling)
A/D conversion				At completion of A/D conversion	Valid when A/D interrupt is selected
BRK instruction	17	FFDD <sub>16</sub>	FFDC <sub>16</sub>	At BRK instruction execution	Non-maskable software interrupt

**Notes1:** Vector addresses contain interrupt jump destination addresses.

**2:** Reset function in the same way as an interrupt with the highest priority.

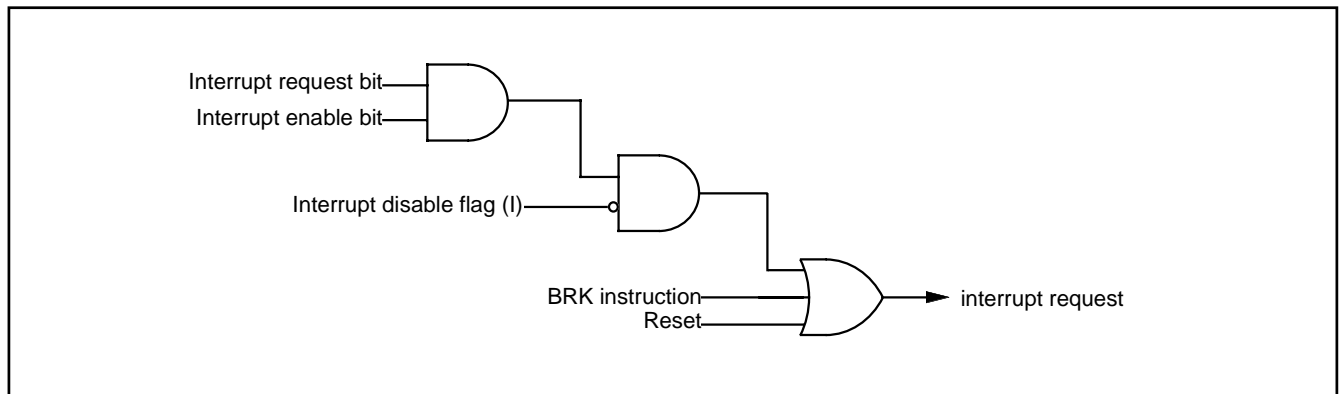

Fig. 16 Interrupt control diagram

### Interrupt Disable Flag

The interrupt disable flag is assigned to bit 2 of the processor status register. This flag controls the acceptance of all interrupt requests except for the BRK instruction. When this flag is set to "1", the acceptance of interrupt requests is disabled. When it is set to "0", acceptance of interrupt requests is enabled. This flag is set to "1" with the SET instruction and set to "0" with the CLI instruction.

When an interrupt request is accepted, the contents of the processor status register are pushed onto the stack while the interrupt disable flag remains set to "0". Subsequently, this flag is automatically set to "1" and multiple interrupts are disabled.

To use multiple interrupts, set this flag to "0" with the CLI instruction within the interrupt processing routine.

The contents of the processor status register are popped off the stack with the RTI instruction.

### Interrupt Request Bits

Once an interrupt request is generated, the corresponding interrupt request bit is set to "1" and remains "1" until the request is accepted. When the request is accepted, this bit is automatically set to "0".

Each interrupt request bit can be set to "0", but cannot be set to "1", by software.

### Interrupt Enable Bits

The interrupt enable bits control the acceptance of the corresponding interrupt requests. When an interrupt enable bit is set to "0", the acceptance of the corresponding interrupt request is disabled. If an interrupt request occurs in this condition, the corresponding interrupt request bit is set to "1", but the interrupt request is not accepted. When an interrupt enable bit is set to "1", acceptance of the corresponding interrupt request is enabled.

Each interrupt enable bit can be set to "0" or "1" by software.

The interrupt enable bit for an unused interrupt should be set to "0".

### Interrupt Source Selection

The following combinations can be selected by the interrupt source selection bit of the AD control register (bit 6 of the address 0039<sub>16</sub>).

- ADT or A/D conversion (refer Table 9)

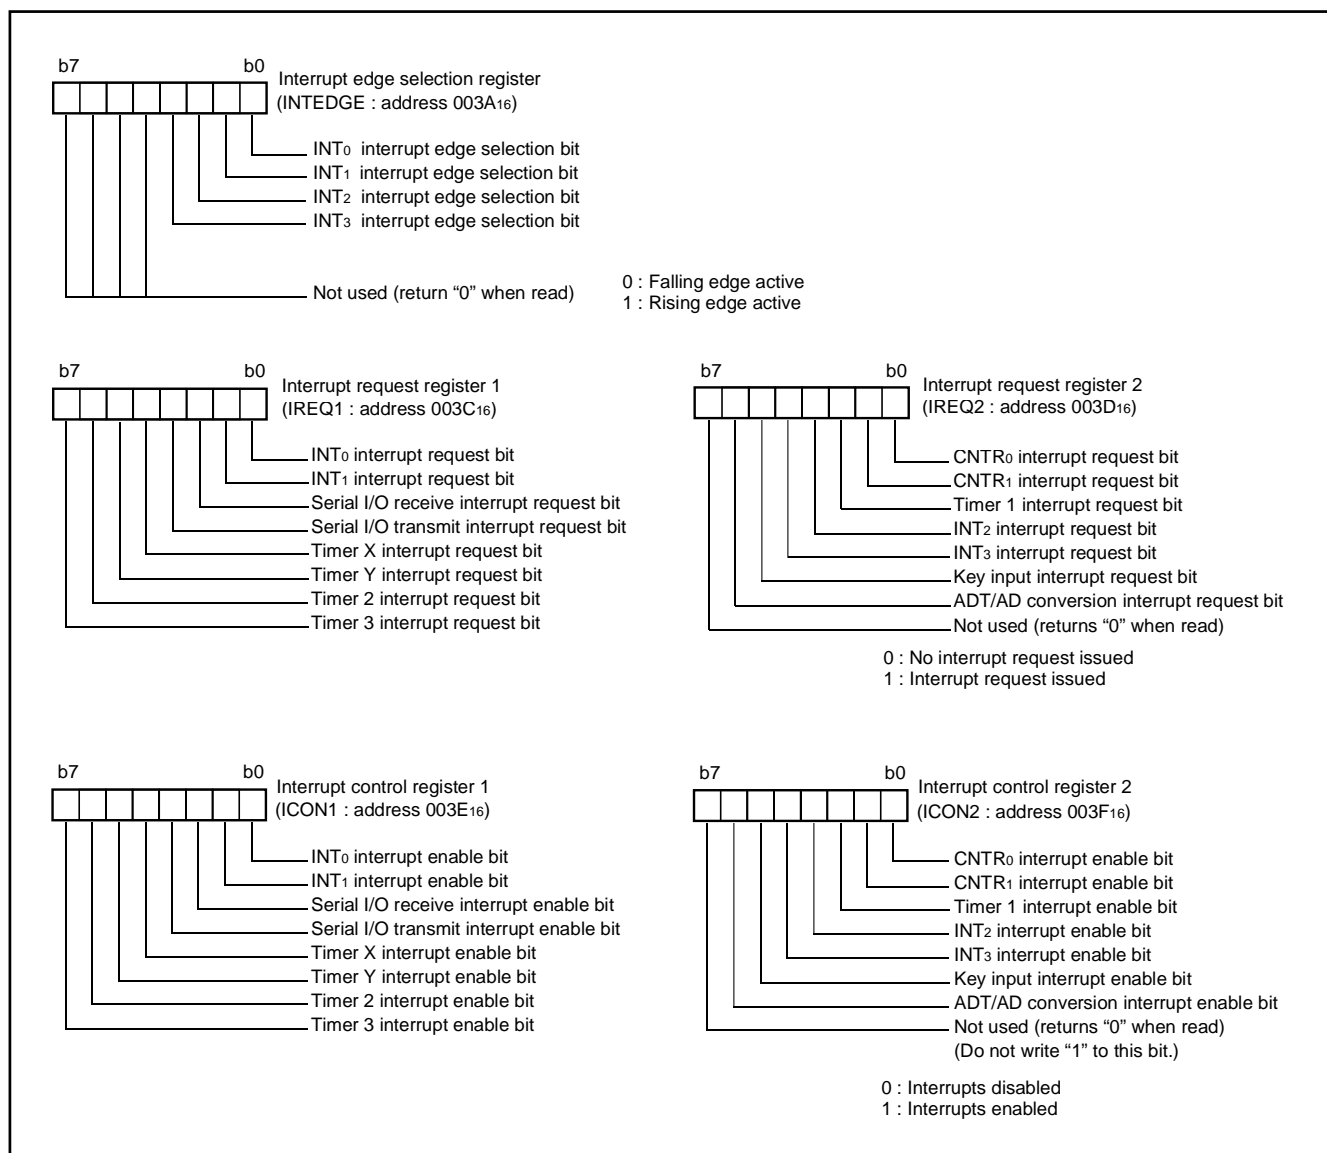

Fig. 17 Structure of interrupt-related registers

## Interrupt Request Generation, Acceptance, and Handling

Interrupts have the following three phases.

- (i) **Interrupt Request Generation**  
An interrupt request is generated by an interrupt source (external interrupt signal input, timer underflow, etc.) and the corresponding request bit is set to "1".
- (ii) **Interrupt Request Acceptance**  
Based on the interrupt acceptance timing in each instruction cycle, the interrupt control circuit determines acceptance conditions (interrupt request bit, interrupt enable bit, and interrupt disable flag) and interrupt priority levels for accepting interrupt requests. When two or more interrupt requests are generated simultaneously, the highest priority interrupt is accepted. The value of interrupt request bit for an unaccepted interrupt remains the same and acceptance is determined at the next interrupt acceptance timing point.
- (iii) **Handling of Accepted Interrupt Request**  
The accepted interrupt request is processed.

Figure 18 shows the time up to execution in the interrupt processing routine, and Figure 19 shows the interrupt sequence.

Figure 20 shows the timing of interrupt request generation, interrupt request bit, and interrupt request acceptance.

## Interrupt Handling Execution

When interrupt handling is executed, the following operations are performed automatically.

- (1) Once the currently executing instruction is completed, an interrupt request is accepted.
- (2) The contents of the program counters and the processor status register at this point are pushed onto the stack area in order from 1 to 3.
  1. High-order bits of program counter (PCH)
  2. Low-order bits of program counter (PCL)
  3. Processor status register (PS)
- (3) Concurrently with the push operation, the jump address of the corresponding interrupt (the start address of the interrupt processing routine) is transferred from the interrupt vector to the program counter.
- (4) The interrupt request bit for the corresponding interrupt is set to "0". Also, the interrupt disable flag is set to "1" and multiple interrupts are disabled.
- (5) The interrupt routine is executed.
- (6) When the RTI instruction is executed, the contents of the registers pushed onto the stack area are popped off in the order from 3 to 1. Then, the routine that was before running interrupt processing resumes.

As described above, it is necessary to set the stack pointer and the jump address in the vector area corresponding to each interrupt to execute the interrupt processing routine.

### ■Notes

The interrupt request bit may be set to "1" in the following cases.

- When setting the external interrupt active edge

Related registers: Interrupt edge selection register

(address 003A16)

Timer X mode register (address 002716)

Timer Y mode register (address 002816)

If it is not necessary to generate an interrupt synchronized with these settings, take the following sequence.

- (1) Set the corresponding enable bit to "0" (disabled).
- (2) Set the interrupt edge selection bit (the active edge switch bit) or the interrupt source bit.
- (3) Set the corresponding interrupt request bit to "0" after one or more instructions have been executed.
- (4) Set the corresponding interrupt enable bit to "1" (enabled).

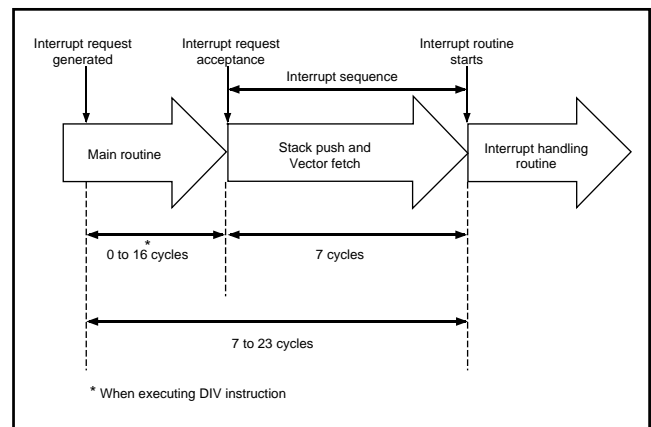

Fig. 18 Time up to execution in interrupt routine

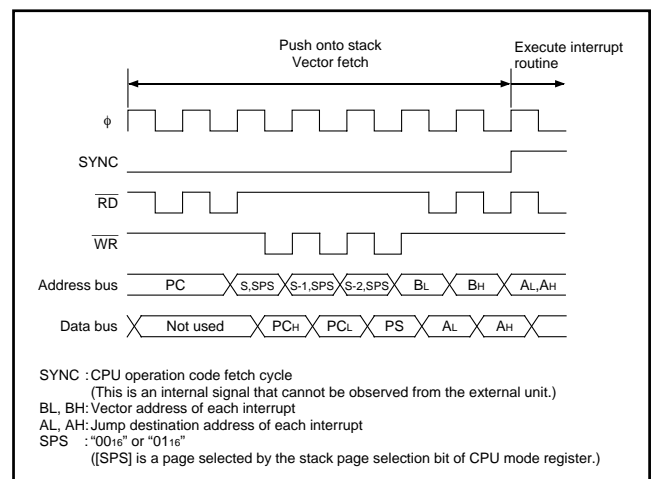

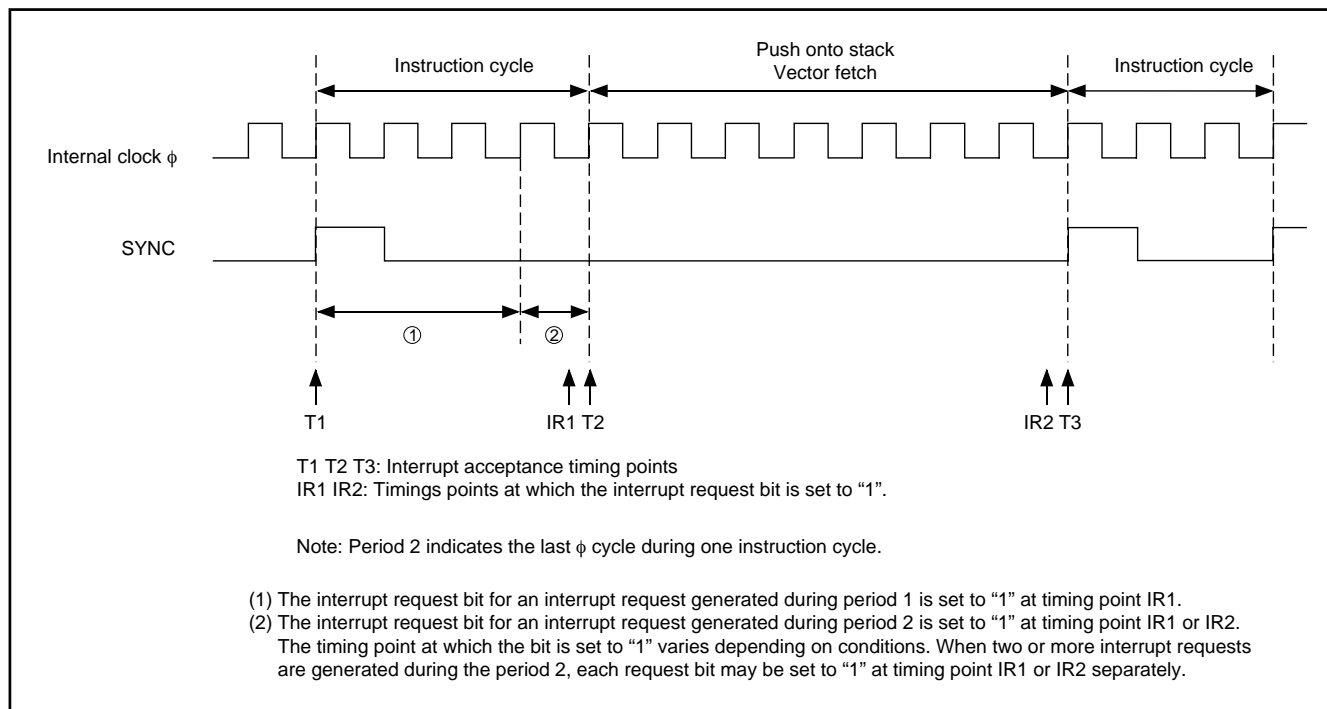

Fig. 19 Interrupt sequence

**Fig. 20 Timing of interrupt request generation, interrupt request bit, and interrupt acceptance**

### Key Input Interrupt (Key-on wake-up)

A Key-on wake-up interrupt request is generated by applying a falling edge to any pin of port P2 that have been set to input mode. In other words, it is generated when AND of input level goes from

"1" to "0". An example of using a key input interrupt is shown in Figure 21, where an interrupt request is generated by pressing one of the keys consisted as an active-low key matrix which inputs to ports P20–P23.

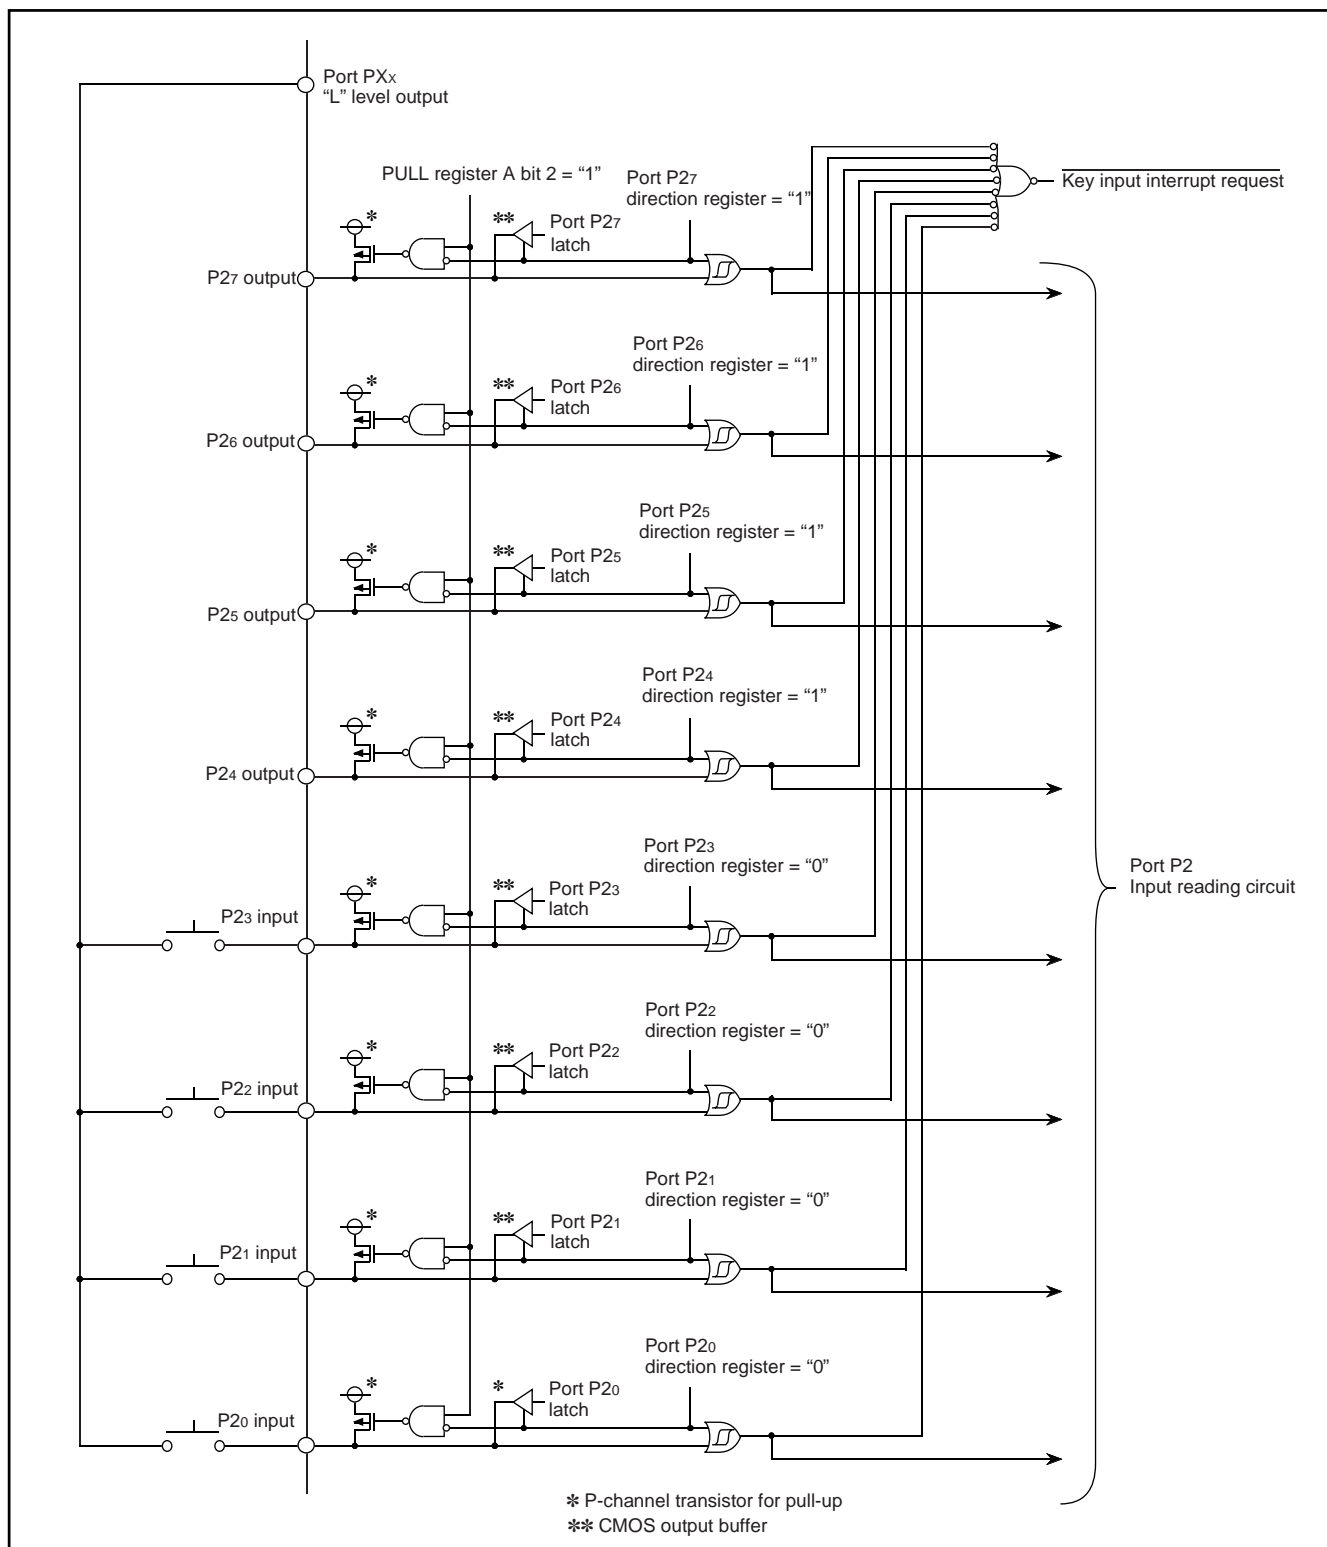

Fig. 21 Connection example when using key input interrupt and port P2 block diagram

## TIMERS

The 3823 group has five timers: timer X, timer Y, timer 1, timer 2, and timer 3. Timer X and timer Y are 16-bit timers, and timer 1, timer 2, and timer 3 are 8-bit timers.

All timers are down count timers. When the timer reaches "0016", an underflow occurs at the next count pulse and the corresponding timer latch is reloaded into the timer and the count is continued. When a timer underflows, the interrupt request bit cor-

responding to that timer is set to "1".

Read and write operation on 16-bit timer must be performed for both high and low-order bytes. When reading a 16-bit timer, read the high-order byte first. When writing to a 16-bit timer, write the low-order byte first. The 16-bit timer cannot perform the correct operation when reading during the write operation, or when writing during the read operation.

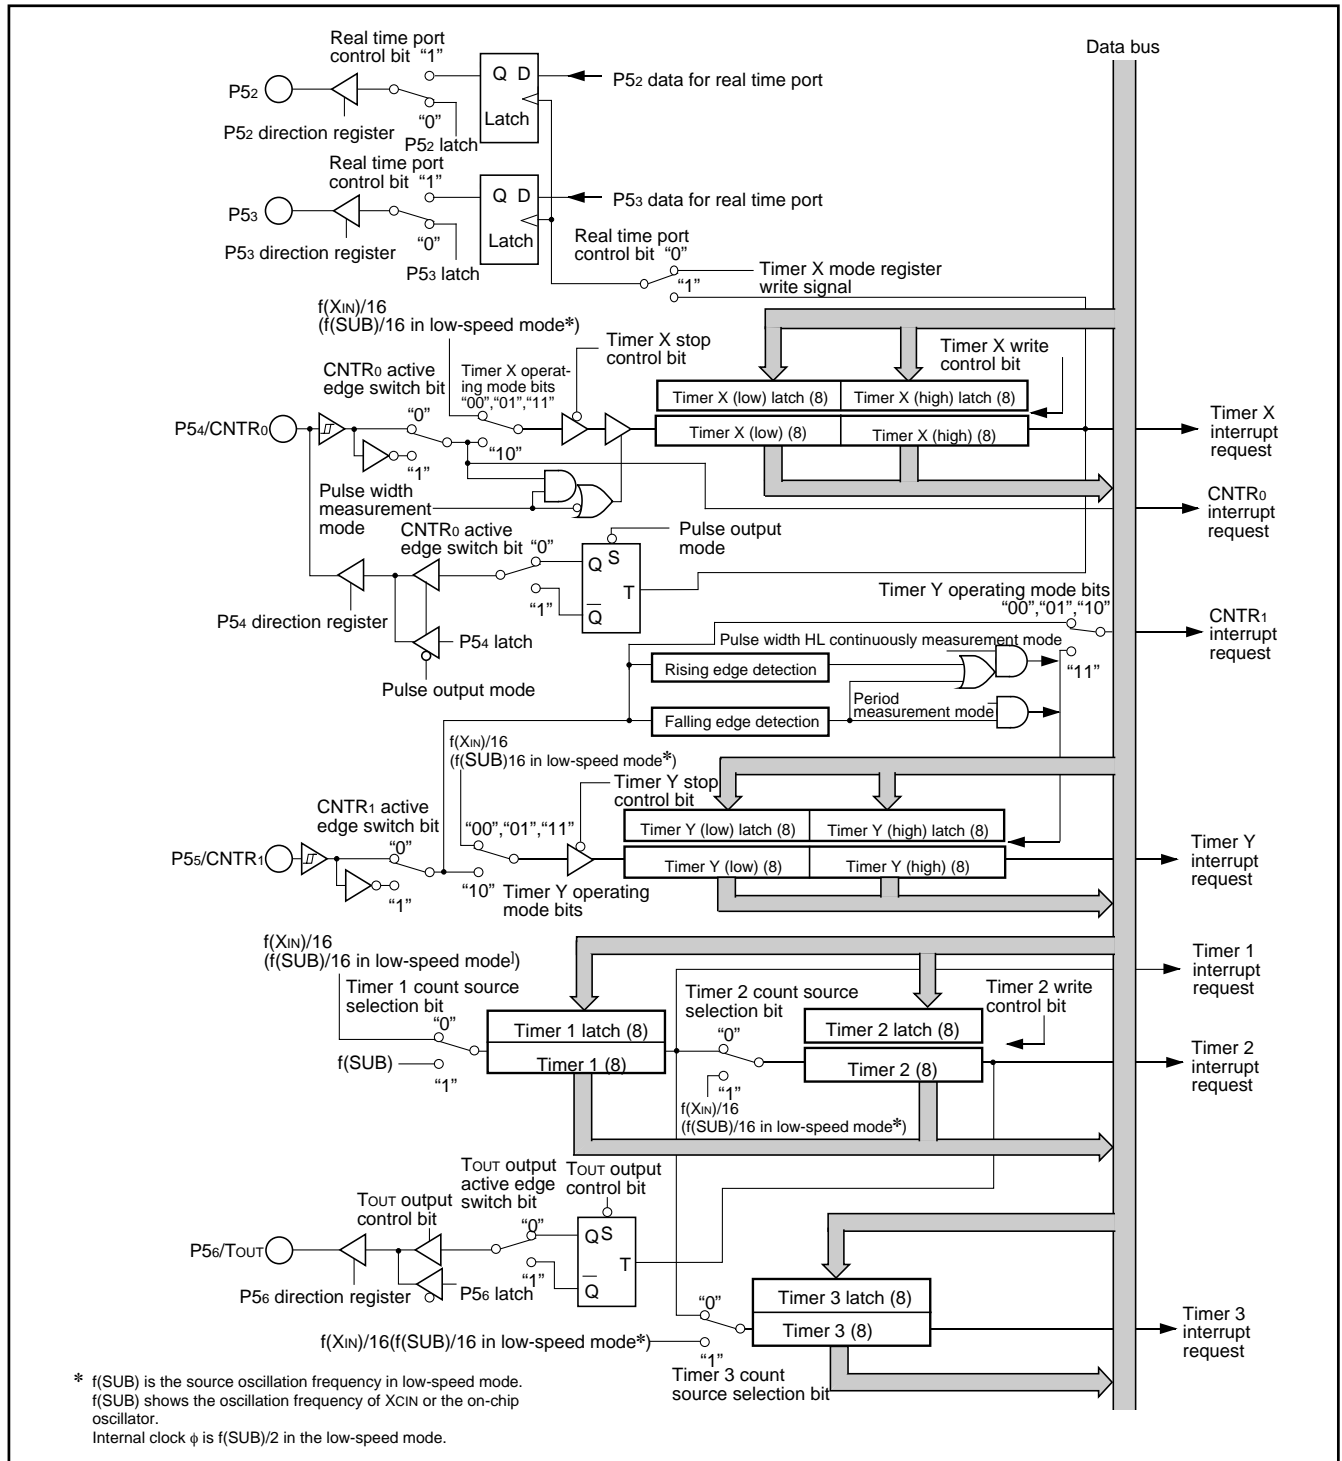

Fig. 22 Timer block diagram

## Timer X

Timer X is a 16-bit timer that can be selected in one of four modes and can be controlled the timer X write and the real time port by setting the timer X mode register.

### (1) Timer Mode

The timer counts  $f(XIN)/16$  (or  $f(SUB)/16$  in low-speed mode).

$f(SUB)$  is the source oscillation frequency in low-speed mode.

$f(SUB)$  shows the oscillation frequency of  $X_{CIN}$  or the on-chip oscillator. Internal clock  $\phi$  is  $f(X_{CIN})/2$  in the low-speed mode.

### (2) Pulse Output Mode

Each time the timer underflows, a signal output from the CNTR0 pin is inverted. Except for this, the operation in pulse output mode is the same as in timer mode. When using a timer in this mode, set the corresponding port P54 direction register to output mode.

### (3) Event Counter Mode

The timer counts signals input through the CNTR0 pin.

Except for this, the operation in event counter mode is the same as in timer mode. When using a timer in this mode, set the corresponding port P54 direction register to input mode.

### (4) Pulse Width Measurement Mode

The count source is  $f(XIN)/16$  (or  $f(SUB)/16$  in low-speed mode). If CNTR0 active edge switch bit is "0", the timer counts while the input signal of CNTR0 pin is at "H". If it is "1", the timer counts while the input signal of CNTR0 pin is at "L". When using a timer in this mode, set the corresponding port P54 direction register to input mode.

#### ●Timer X write control

If the timer X write control bit is "0", when the value is written in the address of timer X, the value is loaded in the timer X and the latch at the same time.

If the timer X write control bit is "1", when the value is written in the address of timer X, the value is loaded only in the latch. The value in the latch is loaded in timer X after timer X underflows.

If the value is written in latch only, when writing in the timer latch at the timer underflow, the value is set in the timer and the latch at one time. Additionally, unexpected value may be set in the high-order counter when the writing in high-order latch and the underflow of timer X are performed at the same timing.

#### ●Real time port control

While the real time port function is valid, data for the real time port are output from ports P52 and P53 each time the timer X underflows. (However, after rewriting a data for real time port, if the real time port control bit is changed from "0" to "1", data are output independent of the timer X operation.) If the data for the real time port is changed while the real time port function is valid, the changed data are output at the next underflow of timer X.

Before using this function, set the corresponding port direction registers to output mode.

#### ■Note on CNTR0 interrupt active edge selection

CNTR0 interrupt active edge depends on the CNTR0 active edge switch bit.

Fig. 23 Structure of timer X mode register

## Timer Y

Timer Y is a 16-bit timer that can be selected in one of four modes.

### (1) Timer Mode

The timer counts  $f(\text{XIN})/16$  (or  $f(\text{SUB})/16$  in low-speed mode).

### (2) Period Measurement Mode

CNTR1 interrupt request is generated at rising/falling edge of CNTR1 pin input signal. Simultaneously, the value in timer Y latch is reloaded in timer Y and timer Y continues counting down. Except for the above-mentioned, the operation in period measurement mode is the same as in timer mode.

The timer value just before the reloading at rising/falling of CNTR1 pin input signal is retained until the timer Y is read once after the reload.

The rising/falling timing of CNTR1 pin input signal is found by CNTR1 interrupt. When using a timer in this mode, set the corresponding port P55 direction register to input mode.

### (3) Event Counter Mode

The timer counts signals input through the CNTR1 pin.

Except for this, the operation in event counter mode is the same as in timer mode. When using a timer in this mode, set the corresponding port P55 direction register to input mode.

### (4) Pulse Width HL Continuously Measurement Mode

CNTR1 interrupt request is generated at both rising and falling edges of CNTR1 pin input signal. Except for this, the operation in pulse width HL continuously measurement mode is the same as in period measurement mode. When using a timer in this mode, set the corresponding port P55 direction register to input mode.

#### ■Note on CNTR1 interrupt active edge selection

CNTR1 interrupt active edge depends on the CNTR1 active edge switch bit. However, in pulse width HL continuously measurement mode, CNTR1 interrupt request is generated at both rising and falling edges of CNTR1 pin input signal regardless of the setting of CNTR1 active edge switch bit.

Fig. 24 Structure of timer Y mode register

### Timer 1, Timer 2, Timer 3

Timer 1, timer 2, and timer 3 are 8-bit timers. The count source for each timer can be selected by timer 123 mode register. The timer latch value is not affected by a change of the count source. However, because changing the count source may cause an inadvertent count down of the timer, rewrite the value of timer whenever the count source is changed.

#### ●Timer 2 write control

If the timer 2 write control bit is "0", when the value is written in the address of timer 2, the value is loaded in the timer 2 and the latch at the same time.

If the timer 2 write control bit is "1", when the value is written in the address of timer 2, the value is loaded only in the latch. The value in the latch is loaded in timer 2 after timer 2 underflows.

#### ●Timer 2 output control

When the timer 2 (TOUT) is output enabled, an inversion signal from the TOUT pin is output each time timer 2 underflows.

In this case, set the port shared with the TOUT pin to the output mode.

### ■Notes on timer 1 to timer 3

When the count source of timer 1 to 3 is changed, the timer counting value may be changed large because a thin pulse is generated in count input of timer. If timer 1 output is selected as the count source of timer 2 or timer 3, when timer 1 is written, the counting value of timer 2 or timer 3 may be changed large because a thin pulse is generated in timer 1 output.

Therefore, set the value of timer in the order of timer 1, timer 2 and timer 3 after the count source selection of timer 1 to 3.

Fig. 25 Structure of timer 123 mode register

## (2) Asynchronous Serial I/O (UART) Mode

Clock asynchronous serial I/O mode (UART) can be selected by clearing the serial I/O mode selection bit of the serial I/O control register to "0".

Eight serial data transfer formats can be selected, and the transfer formats used by a transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer regis-

ter, but the two buffers have the same address in memory. Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer, and receive data is read from the receive buffer.

The transmit buffer can also hold the next data to be transmitted, and the receive buffer register can hold a character while the next character is being received.

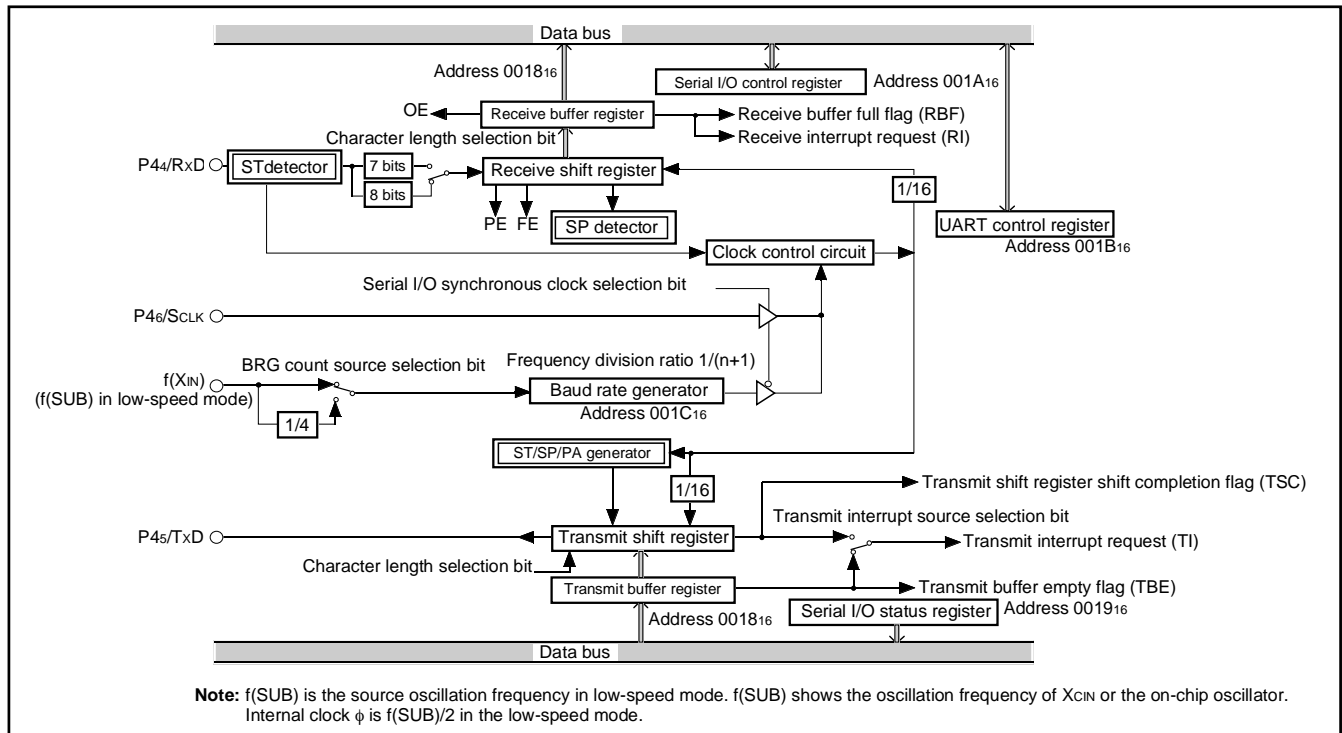

Fig. 28 Block diagram of UART serial I/O

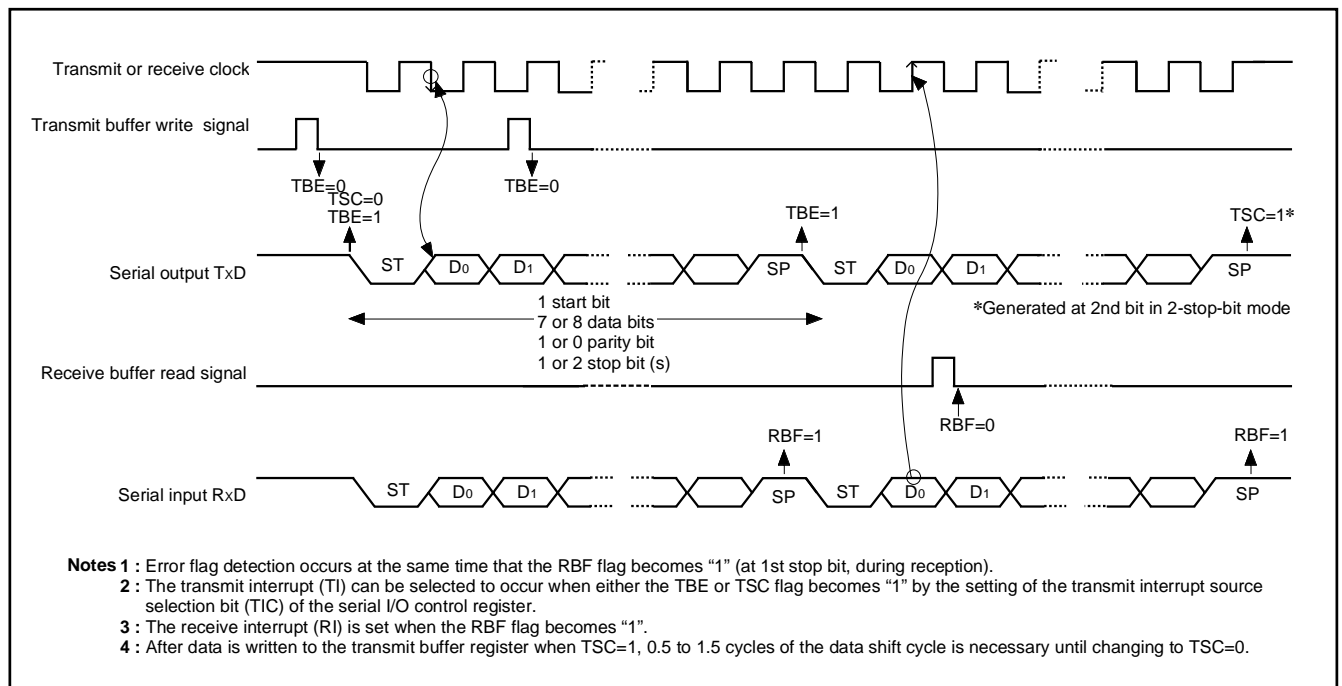

Fig. 29 Operation of UART serial I/O function

### (3) Synchronous/Asynchronous Alternate Transmit Mode

Synchronous/asynchronous alternate transmit mode is selected by setting the transmit enable bit in the serial I/O control register to "1" after setting the synchronous serial I/O output pin selection bit in the peripheral function expansion register to "1". Set the synchronous serial I/O output pin selection bit to "1" when the serial I/O mode selection bit is set to "0". In this mode, transmit cannot be performed continuously. Write to the transmit buffer register after

confirming that the transmit shift register is set to "1", and then changing the serial I/O mode selection bit. The SRDY output function cannot be used when the clock synchronous serial I/O is selected. Also, when using the internal clock for the transfer clock (the serial I/O synchronous clock selection bit is set to "0"), apply "H" output to the P46 pin. The other operation is the same as clock synchronous serial I/O mode and asynchronous serial I/O mode (UART).

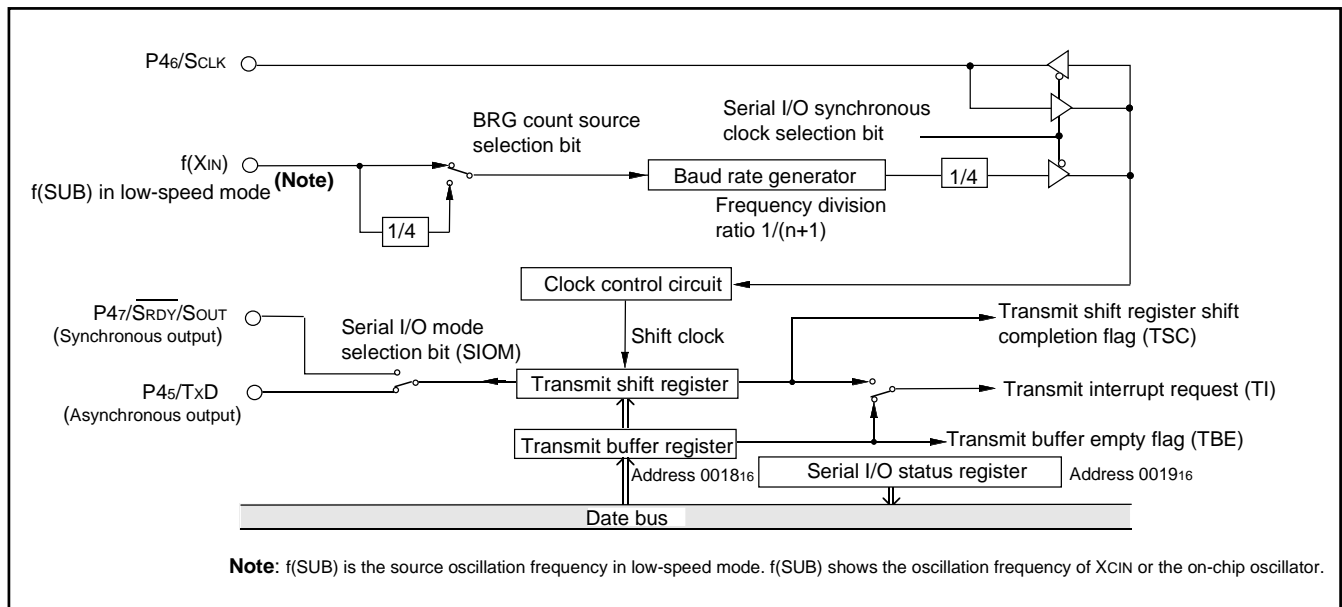

Fig. 30 Block diagram of synchronous/asynchronous alternate transmit

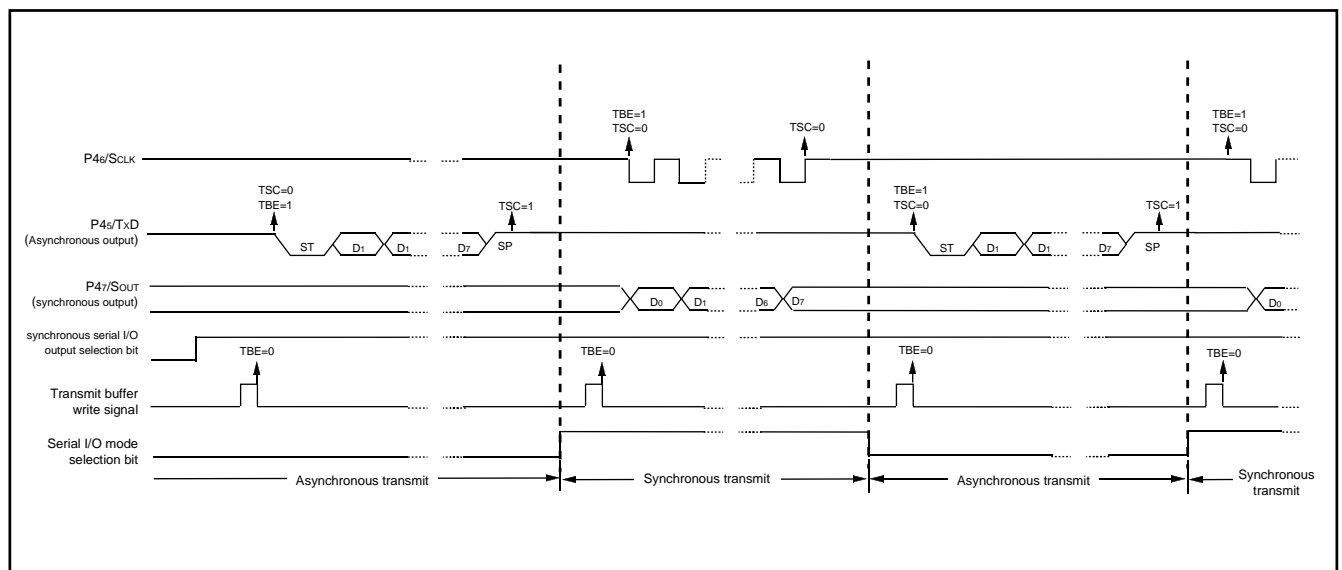

Fig. 31 Operation of synchronous/asynchronous alternate transmit function

**[Transmit Buffer/Receive Buffer Register (TB/RB)] 0018<sub>16</sub>**

The transmit buffer register and the receive buffer register are located at the same address. The transmit buffer register is write-only and the receive buffer register is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer register is "0".

**[Serial I/O Status Register (SIOSTS)] 0019<sub>16</sub>**

The read-only serial I/O status register consists of seven flags (bits 0 to 6) which indicate the operating status of the serial I/O function and various errors.

Three of the flags (bits 4 to 6) are valid only in UART mode.

The receive buffer full flag (bit 1) is cleared to "0" when the receive buffer is read.

If there is an error, it is detected at the same time that data is transferred from the receive shift register to the receive buffer register, and the receive buffer full flag is set. A write to the serial I/O status register clears all the error flags OE, PE, FE, and SE. Writing "0" to the serial I/O enable bit (SIOE) also clears all the status flags, including the error flags.

All bits of the serial I/O status register are initialized to "0" at reset, but if the transmit enable bit (bit 4) of the serial I/O control register has been set to "1", the transmit shift register shift completion flag (bit 2) and the transmit buffer empty flag (bit 0) become "1".

**[Serial I/O Control Register (SIOCON)] 001A<sub>16</sub>**

The serial I/O control register contains eight control bits for the serial I/O function.

**[UART Control Register (UARTCON)] 001B<sub>16</sub>**

The UART control register consists of four control bits (bits 0 to 3) which are valid when asynchronous serial I/O is selected and set the data format of an data transfer. One bit in this register (bit 4) is always valid and sets the output structure of the P45/TxD pin.

**[Baud Rate Generator (BRG)] 001C<sub>16</sub>**

The baud rate generator determines the baud rate for serial transfer.

The baud rate generator divides the frequency of the count source by  $1/(n + 1)$ , where  $n$  is the value written to the baud rate generator.

**■Notes on serial I/O**

When setting the transmit enable bit to "1", the serial I/O transmit interrupt request bit is automatically set to "1". When not requiring the interrupt occurrence synchronized with the transmission enabled, take the following sequence.

- ①Set the serial I/O transmit interrupt enable bit to "0" (disabled).
- ②Set the transmit enable bit to "1".
- ③Set the serial I/O transmit interrupt request bit to "0" after 1 or more instructions have been executed.
- ④Set the serial I/O transmit interrupt enable bit to "1" (enabled).

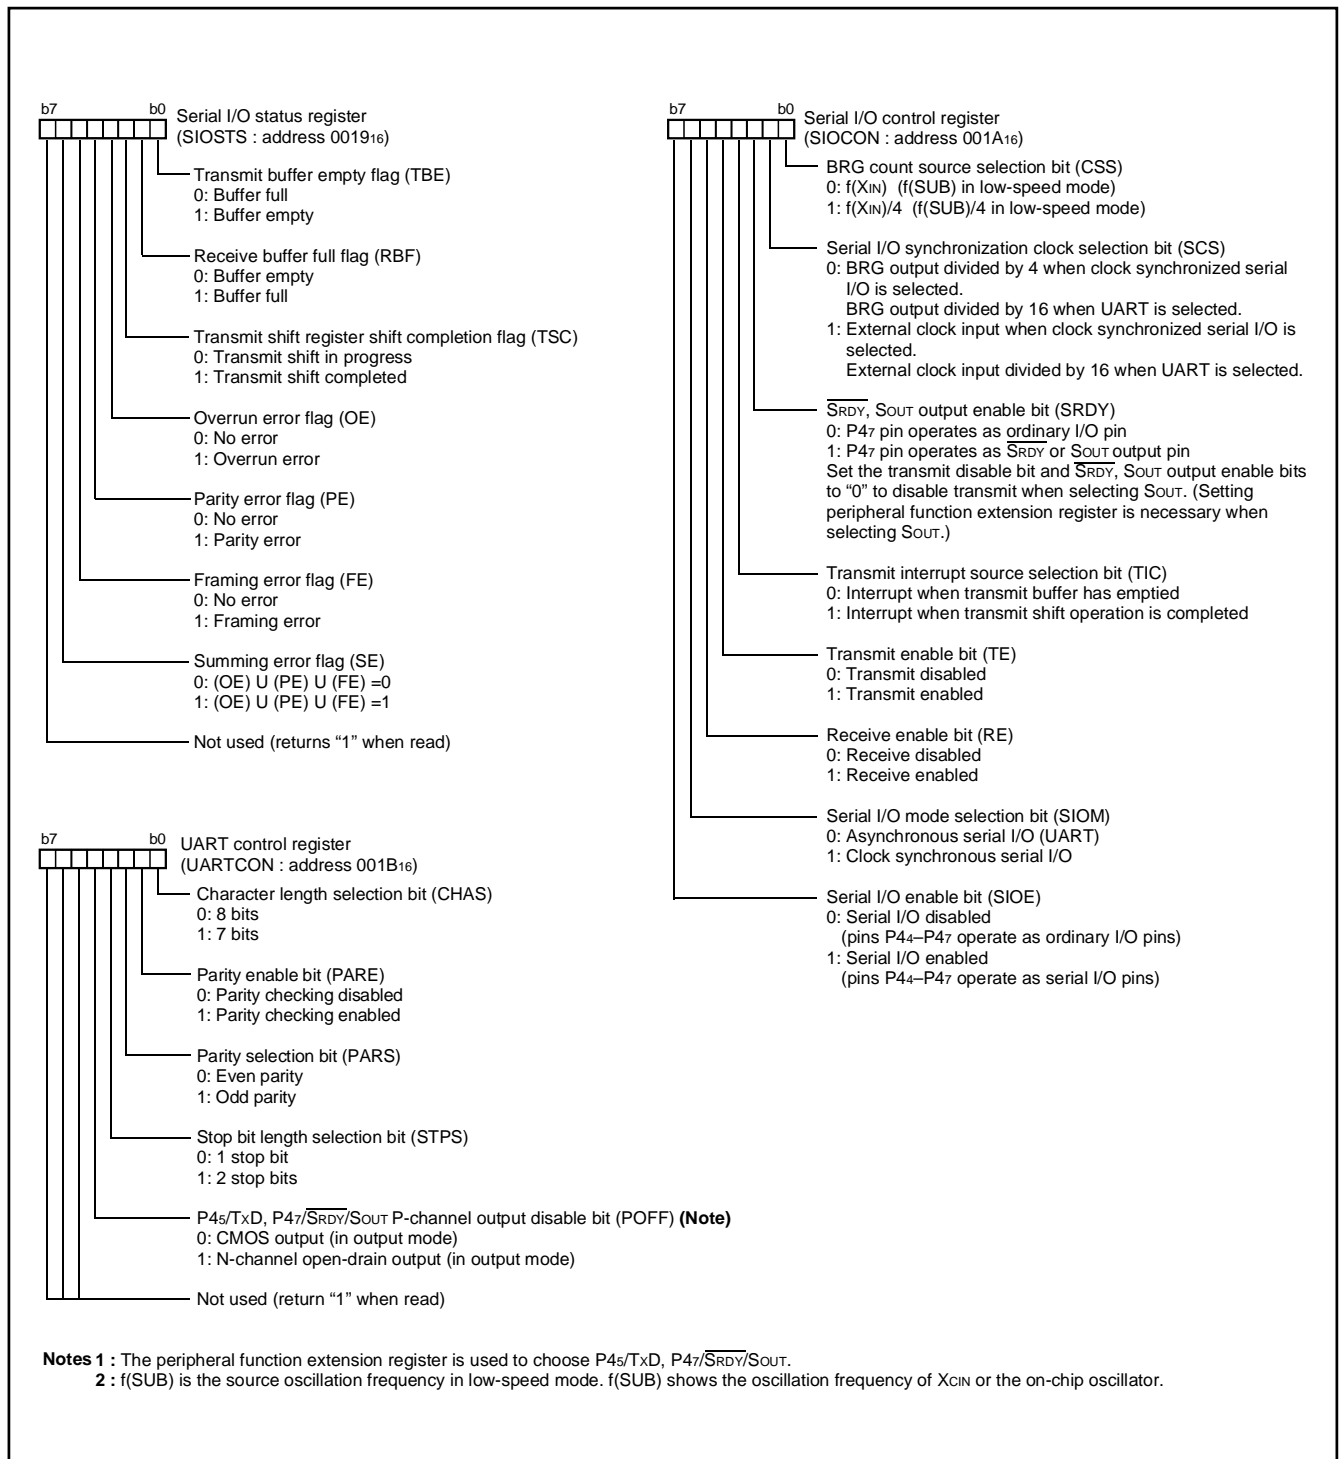

Fig. 32 Structure of serial I/O control registers

## A/D CONVERTER

### [AD Conversion Register (ADH, ADL)] 003516

The AD conversion register is a read-only register that contains the result of an A/D conversion. When reading this register during an A/D conversion, the previous conversion result is read. The high-order 8 bits of a conversion result is stored in the AD conversion high-order register (address 003516), and the low-order 2 bits of the same result are stored in bit 7 and bit 6 of the AD conversion low-order register (address 003616).

The bit 0 in the AD conversion low-order register is used as the conversion mode selection bit. 8-bit A/D mode is selected by setting this bit to "0" and 10-bit A/D mode is selected by setting it to "1".

### [AD Control Register (ADCON)] 003416

The AD control register controls the A/D conversion process. Bits 0 to 2 of this register select specific analog input pins. Bit 3 signals the completion of an A/D conversion. The value of this bit remains at "0" during an A/D conversion, then changes to "1" when the A/D conversion is completed. Writing "0" to this bit starts the A/D conversion. Bit 4 is the VREF input switch bit which controls connection of the resistor ladder and the reference voltage input pin (VREF). The resistor ladder is always connected to VREF when bit 4 is set to "1". When bit 4 is set to "0", the resistor ladder is cut off from VREF except for A/D conversion performed. When bit 5, which is the AD external trigger valid bit, is set to "1", this bit enables A/D conversion even by a falling edge of an ADT input. Set the P57/ADT pin to input mode (set "0" to bit 7 of port P5 direction register) when using an A/D external trigger.

### [Comparison Voltage Generator]

The comparison voltage generator divides the voltage between AVSS and VREF, and outputs the divided voltages.

### [Channel Selector]

The channel selector selects one of the input ports P67/AN7–P60/AN0, and inputs it to the comparator.

### [Comparator and Control Circuit]

The comparator and control circuit compares an analog input voltage with the comparison voltage and stores the result in the AD conversion register. When an A/D conversion is completed, the control circuit sets the AD conversion completion bit and the AD interrupt request bit to "1".

The comparator is constructed linked to a capacitor. The conversion accuracy may be low because the charge is lost if the conversion speed is not enough. Accordingly, set  $f(X_{IN})$  to at least 500kHz during A/D conversion in the middle-or high-speed mode. Also, do not execute the STP or WIT instruction during an A/D conversion.

In the low-speed mode, since the A/D conversion is executed by the built-in self-oscillation circuit, the minimum value of  $f(X_{IN})$  frequency is not limited.

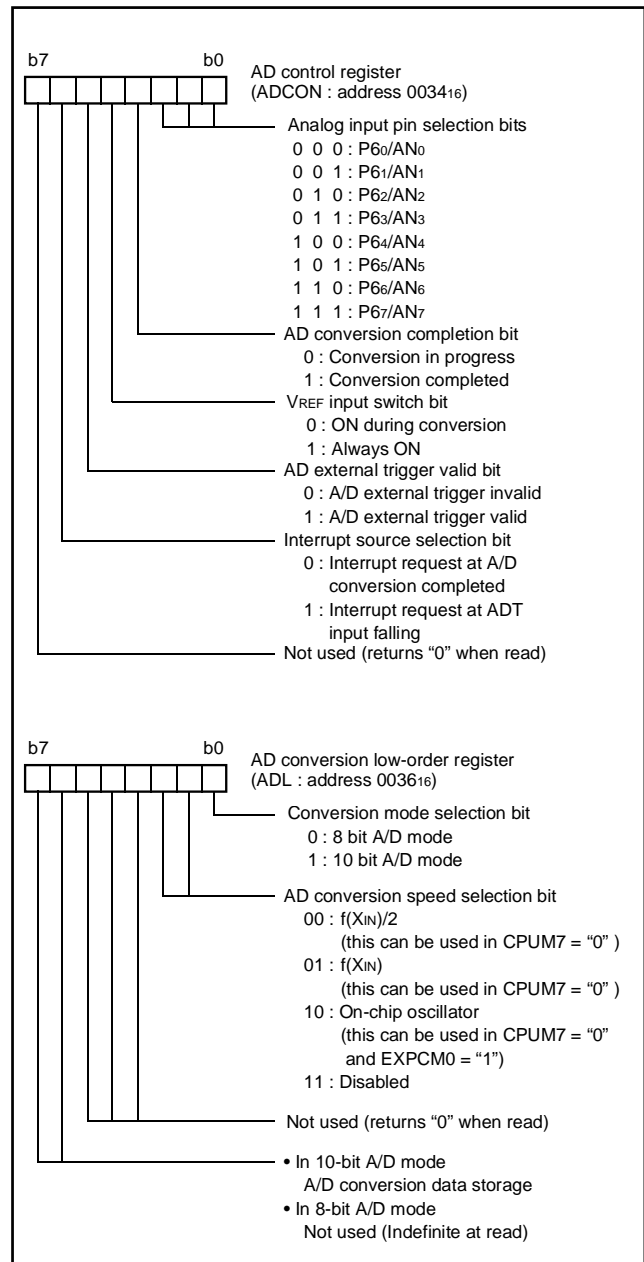

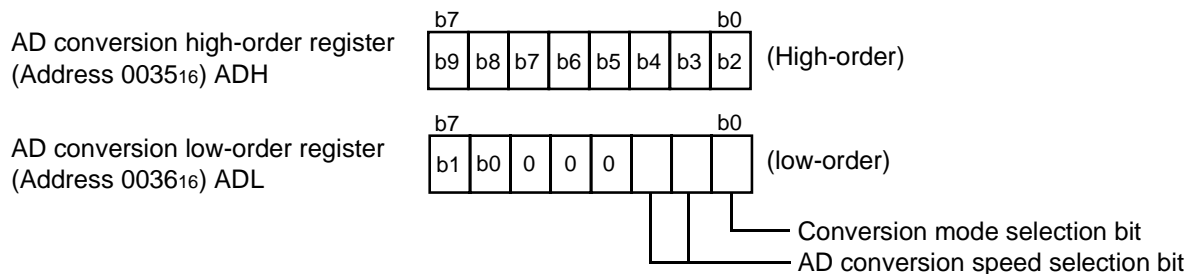

Fig. 33 Structure of AD conversion-related registers

- 10 bit reading (Read address 0035<sub>16</sub> before 0036<sub>16</sub>)

Note: The bit 5 to bit 3 of address 0036<sub>16</sub> become "0" at reading.

- 8 bit reading (Read only address 0035<sub>16</sub>)

Fig. 34 A/D conversion register reading

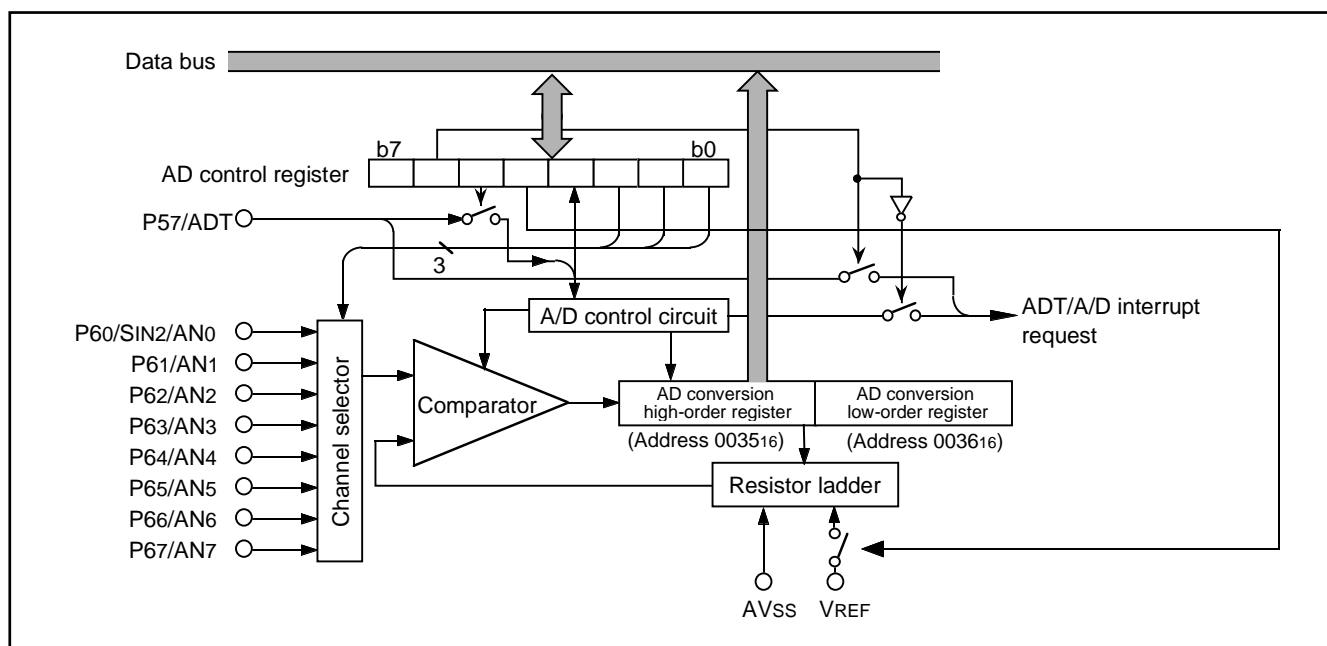

Fig. 35 A/D converter block diagram

## LCD DRIVE CONTROL CIRCUIT

The 3823 group has the built-in Liquid Crystal Display (LCD) drive control circuit consisting of the following.

- LCD display RAM
- Segment output enable register
- LCD mode register
- Selector
- Timing controller
- Common driver
- Segment driver
- Bias control circuit

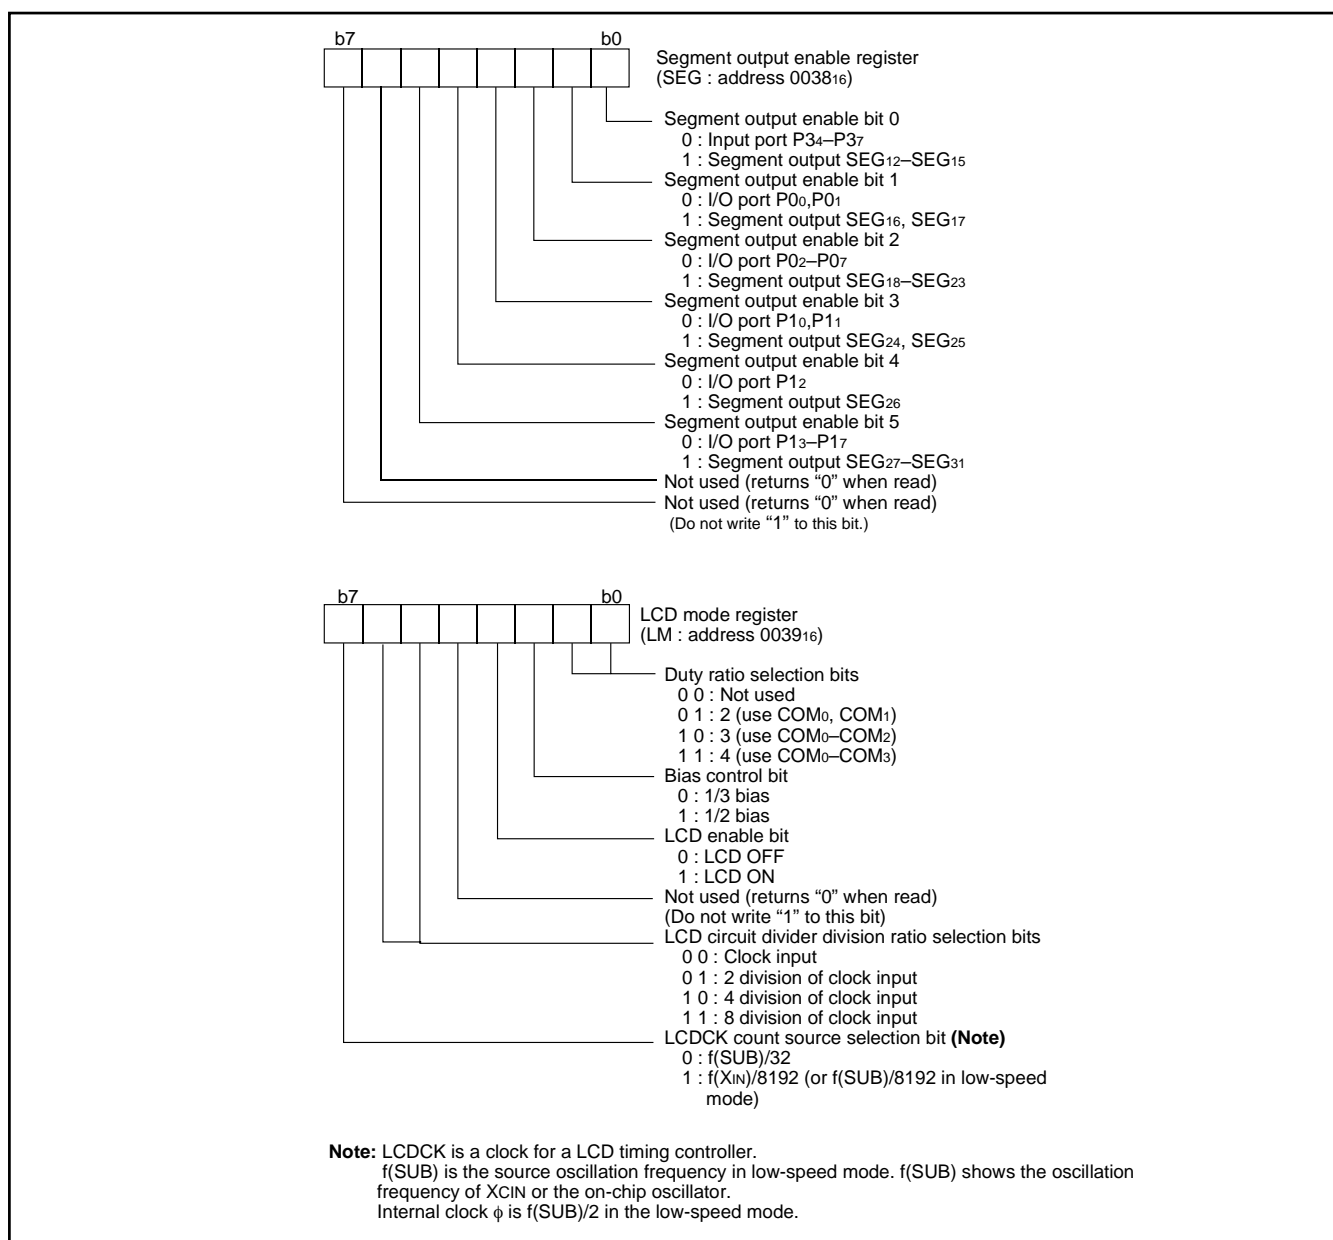

A maximum of 32 segment output pins and 4 common output pins can be used.

Up to 128 pixels can be controlled for LCD display. When the LCD

enable bit is set to "1" after data is set in the LCD mode register, the segment output enable register and the LCD display RAM, the LCD drive control circuit starts reading the display data automatically, performs the bias control and the duty ratio control, and displays the data on the LCD panel.

**Table 10 Maximum number of display pixels at each duty ratio**

Duty ratio	Maximum number of display pixel
2	64 dots or 8 segment LCD 8 digits
3	96 dots or 8 segment LCD 12 digits
4	128 dots or 8 segment LCD 16 digits

**Fig. 36 Structure of segment output enable register and LCD mode register**

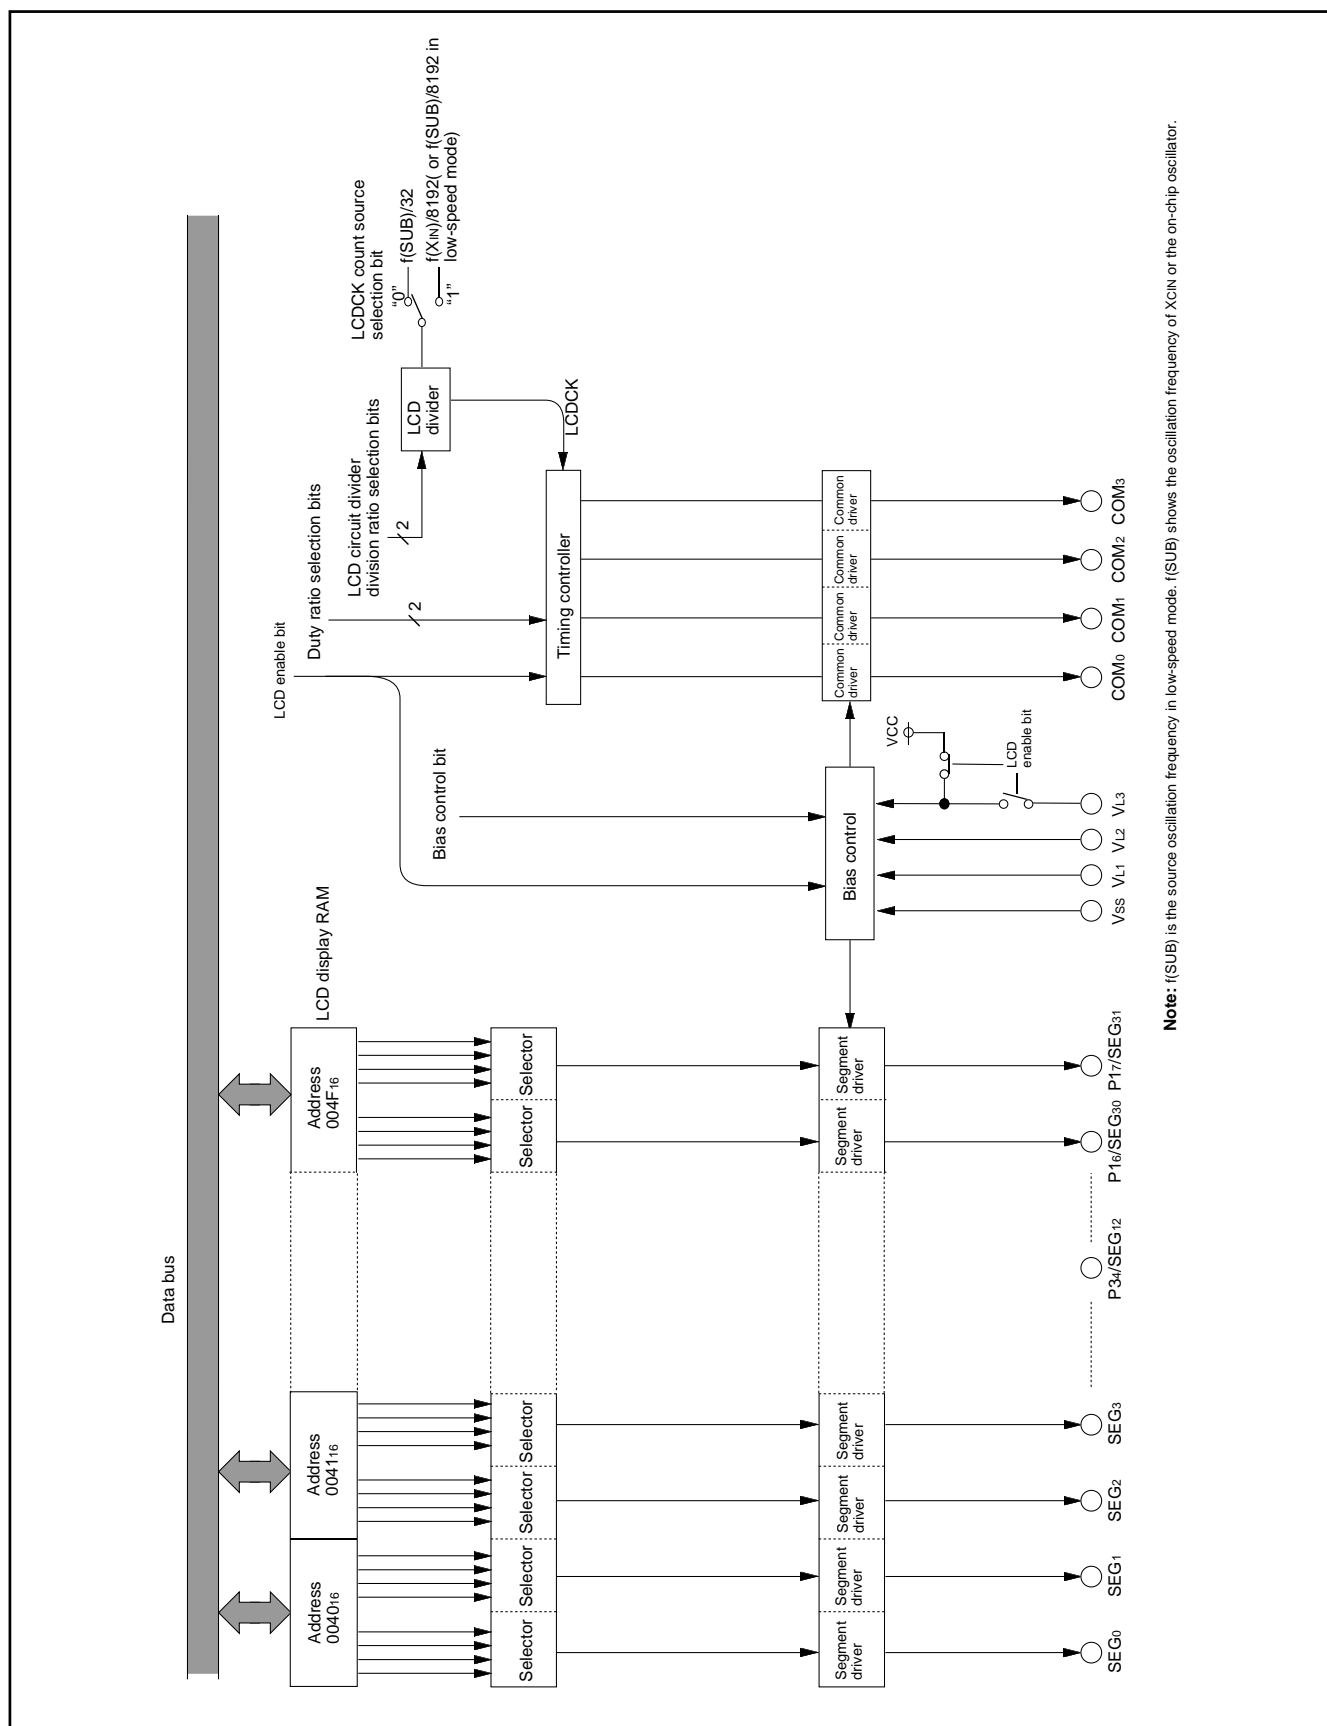

Fig. 37 Block diagram of LCD controller/driver

## Bias Control and Applied Voltage to LCD Power Input Pins

To the LCD power input pins ( $V_{L1}$ – $V_{L3}$ ), apply the voltage shown in Table 11 according to the bias value.

Select a bias value by the bias control bit (bit 2 of the LCD mode register).

## Common Pin and Duty Ratio Control

The common pins ( $COM_0$ – $COM_3$ ) to be used are determined by duty ratio.

Select duty ratio by the duty ratio selection bits (bits 0 and 1 of the LCD mode register).

**Table 11 Bias control and applied voltage to  $V_{L1}$ – $V_{L3}$**

Bias value	Voltage value
1/3 bias	$V_{L3}=V_{LCD}$ $V_{L2}=2/3 V_{LCD}$ $V_{L1}=1/3 V_{LCD}$
1/2 bias	$V_{L3}=V_{LCD}$ $V_{L2}=V_{L1}=1/2 V_{LCD}$

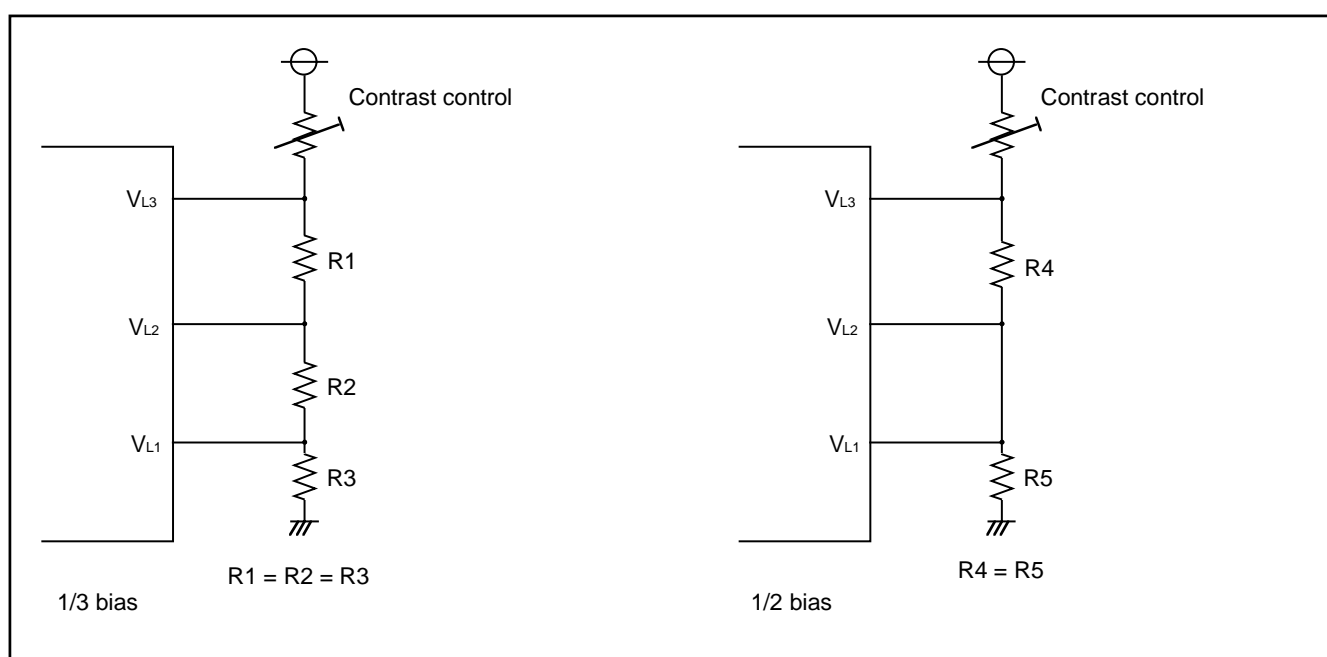

**Note 1:**  $V_{LCD}$  is the maximum value of supplied voltage for the LCD panel.

**Table 12 Duty ratio control and common pins used**

Duty ratio	Duty ratio selection bit		Common pins used
	Bit 1	Bit 0	
2	0	1	$COM_0, COM_1$ ( <b>Note 1</b> )
3	1	0	$COM_0$ – $COM_2$ ( <b>Note 2</b> )
4	1	1	$COM_0$ – $COM_3$

**Notes1:**  $COM_2$  and  $COM_3$  are open.

**2:**  $COM_3$  is open.

**Fig. 38** Example of circuit at each bias

## LCD Display RAM

Address 0040<sub>16</sub> to 004F<sub>16</sub> is the designated RAM for the LCD display. When “1” are written to these addresses, the corresponding segments of the LCD display panel are turned on.

## LCD Drive Timing

The LCDCK timing frequency (LCD drive timing) is generated internally and the frame frequency can be determined with the following equation;

$$f(\text{LCDCK}) = \frac{(\text{frequency of count source for LCDCK})}{(\text{divider division ratio for LCD})}$$

$$\text{Frame frequency} = \frac{f(\text{LCDCK})}{(\text{duty ratio})}$$

Bit Address	7	6	5	4	3	2	1	0
0040 <sub>16</sub>	SEG1				SEG0			
0041 <sub>16</sub>	SEG3				SEG2			
0042 <sub>16</sub>	SEG5				SEG4			
0043 <sub>16</sub>	SEG7				SEG6			
0044 <sub>16</sub>	SEG9				SEG8			
0045 <sub>16</sub>	SEG11				SEG10

004F <sub>16</sub>	SEG31				SEG30			
	COM3	COM2	COM1	COM0	COM3	COM2	COM1	COM0

Fig. 39 LCD display RAM map

## STP Instruction Execution

Execution of the STP instruction sets the LCD enable bit (bit 3 of the LCD mode register) to “0” and the LCD panel turns off. To make the LCD panel turn on after returning from the stop mode, set the LCD enable bit to “1”.

Fig. 40 LCD drive waveform (1/2 bias)

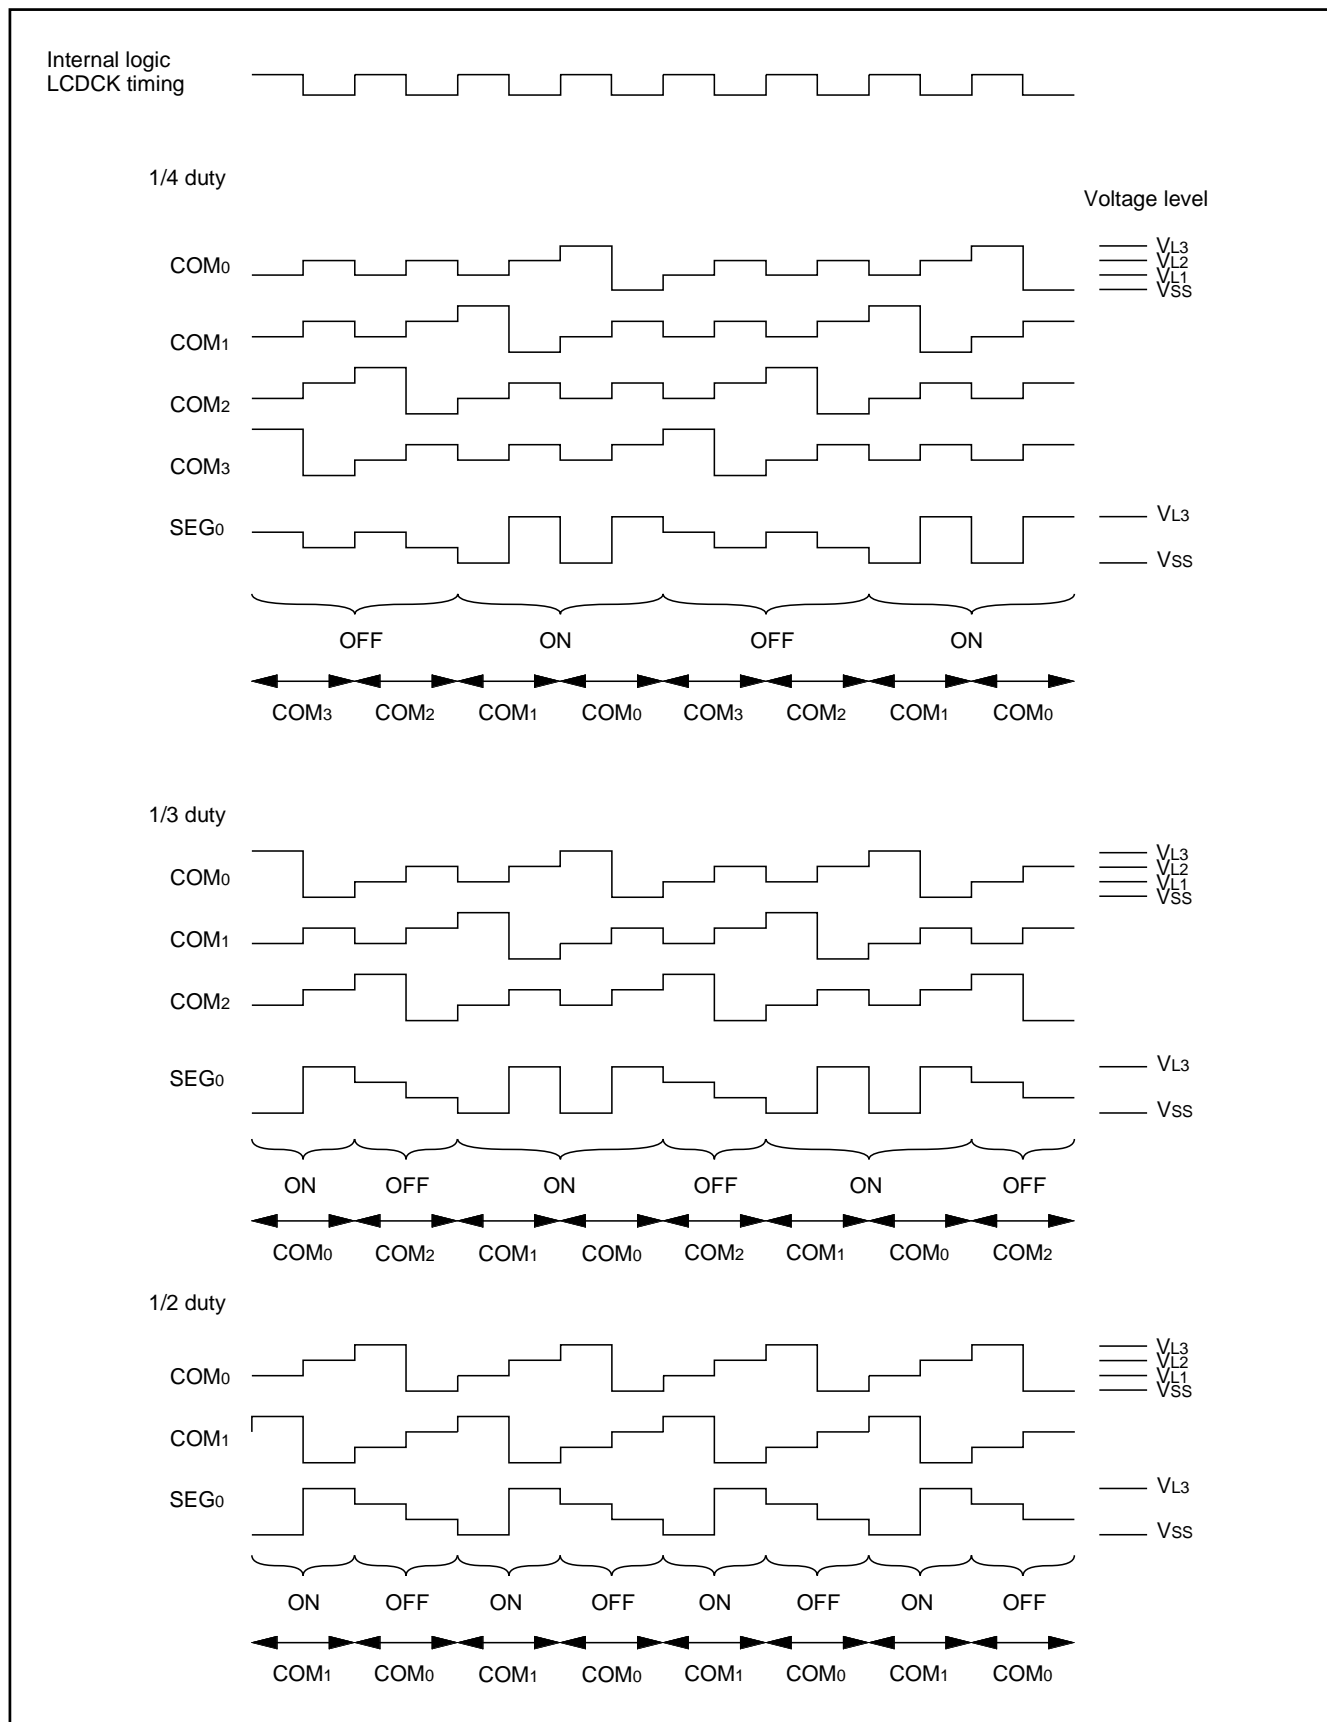

Fig. 41 LCD drive waveform (1/3 bias)

## ROM CORRECTION FUNCTION

A part of program in ROM can be corrected.

Set the start address of the corrected ROM data (i.e. an Op code address of the beginning instruction) to the ROM correction address low-order and high-order registers. The program for the correction is stored in RAM for ROM correction.

When the program is being executed and the value of the program counter matches with the set address value in the the ROM correction address registers, the program is branched to the start address of RAM for ROM correction and then the correction program is executed. Use the JMP instruction (3-byte instruction) to return the main program from the correction program.

The correctable area is up to two. There are two blocks of RAM for ROM correction:

Block 1: Address 0A00<sub>16</sub>

Block 2: Address 0A20<sub>16</sub>

The ROM correction function is controlled by the ROM correction enable register.

If the ROM correction function is not used, the ROM correction vector may be used as normal RAM. When using the ROM correction vector as normal RAM, make sure to set bits 1 and 0 in the ROM correction enable register to "0" (Disable).

- Notes**
- 1: When using the ROM correction function, set the ROM correction address registers and then enable the ROM correction with the ROM correction enable register.
  - 2: Do not set addresses other than the ROM area in the ROM correction address registers.  
Do not set the same addresses in both the ROM correction address 1 registers and the ROM correction address 2 registers.
  - 3: It is necessary to contain the process in the program to transfer the correction program from an external EEPROM and others to the RAM for ROM correction.

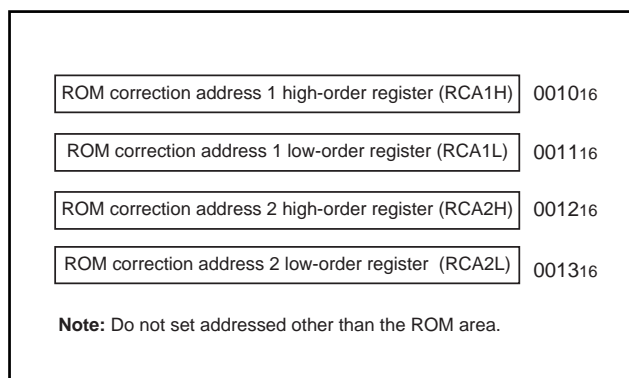

Fig. 42 ROM correction address register

Fig. 43 RAM for ROM correction

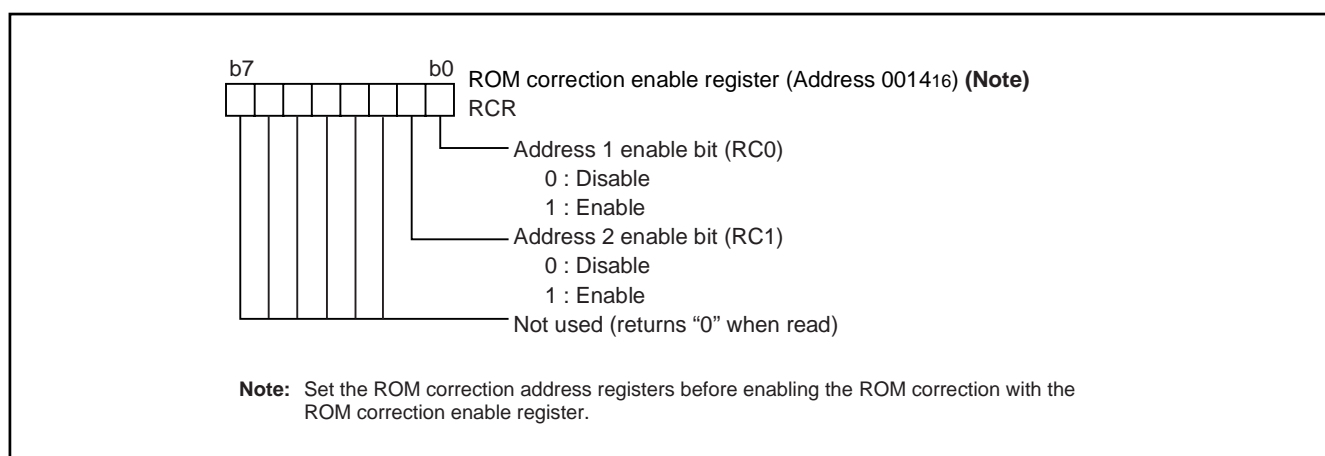

Fig. 44 Structure of ROM correction enable register

## φ CLOCK SYSTEM OUTPUT FUNCTION

The internal system clock φ or XCIN frequency signal can be output from port P41 by setting the φ output control register. Set bit 1 of the port P4 direction register to "1" when outputting φ clock.

Set the bit 4 in the peripheral function expansion register to "1" when the XCIN frequency signal is output.

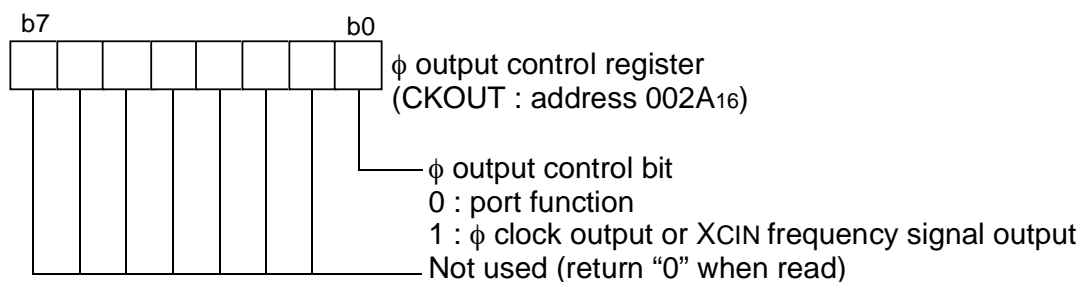

Fig. 45 Structure of φ output control register

## Temporary data register

The temporary data register (addresses 002C<sub>16</sub> to 002E<sub>16</sub>) is the 8-bit register and does not have the control function. It can be used to store data temporarily. It is initialized after reset.

## RRF register

The RRF register (address 002F<sub>16</sub>) is the 8-bit register and does not have the control function. As for the value written in this register, high-order 4 bits and low-order 4 bits interchange. It is initialized after reset.

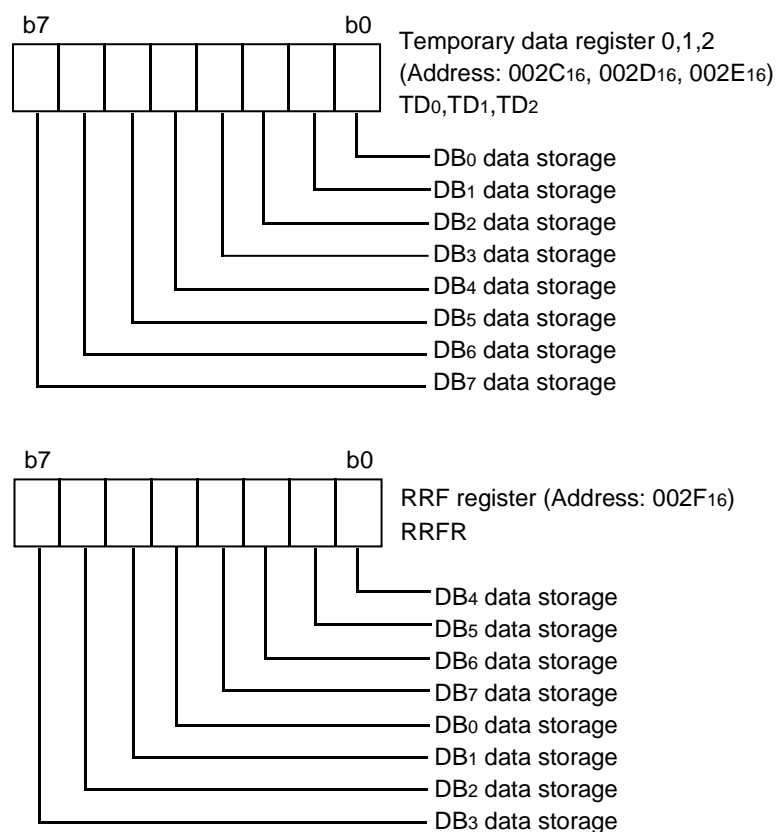

Fig. 46 Structure of temporary register, RPF register

## WATCHDOG TIMER

The watchdog timer gives a mean of returning to the reset status when a program cannot run on a normal loop (for example, because of a software run-away). The watchdog timer consists of an 8-bit counter.

### Initial Value of Watchdog Timer

At reset or writing to the watchdog timer control register, each watchdog timer is set to "FF<sub>16</sub>." Instructions such as STA, LDM and CLB to generate the write signals can be used.

The written data in bits 0 to 5 are not valid, and the above values are set.

Bits 7 and 6 can be rewritten only once after reset.

After rewriting it is disable to write any data to this bit. These bits become "0" after reset.

### Standard Operation of Watchdog Timer

The watchdog timer is in the stop state at reset and the watchdog timer starts to count down by writing an optional value in the watchdog timer control register. An internal reset occurs at an underflow of the watchdog timer. Then, reset is released after the reset release time is elapsed, the program starts from the reset vector address. Normally, writing to the watchdog timer control register before an underflow of the watchdog timer is programmed. If writing to the watchdog timer control register is not

executed, the watchdog timer does not operate.

When reading the watchdog timer control register is executed, the contents of the high-order 6-bit counter and the STP instruction bit (bit 6), and the count source selection bit (bit 7) are read out.

### Bit 6 of Watchdog Timer Control Register

- When bit 6 of the watchdog timer control register is "0", the MCU enters the stop mode by execution of STP instruction. Just after releasing the stop mode, the watchdog timer restarts counting (Note). When executing the WIT instruction, the watchdog timer does not stop.
- When bit 6 is "1", execution of STP instruction causes an internal reset. When this bit is set to "1" once, it cannot be rewritten to "0" by program. Bit 6 is "0" at reset.

The time until the underflow of the watchdog timer register after writing to the watchdog timer control register is executed is as follows (when the bit 7 of the watchdog timer control register is "0") ;

- at frequency/2/4/8 mode ( $f(X_{IN})$ ) = 8 MHz): 32.768 ms
- at low-speed mode ( $f(X_{CIN})$ ) = 32 KHz): 8.19s

### Note

The watchdog timer continues to count even during the wait time set by timer 1 and timer 2 to release the stop state and in the wait mode. Accordingly, do not underflow the watchdog timer in this time.

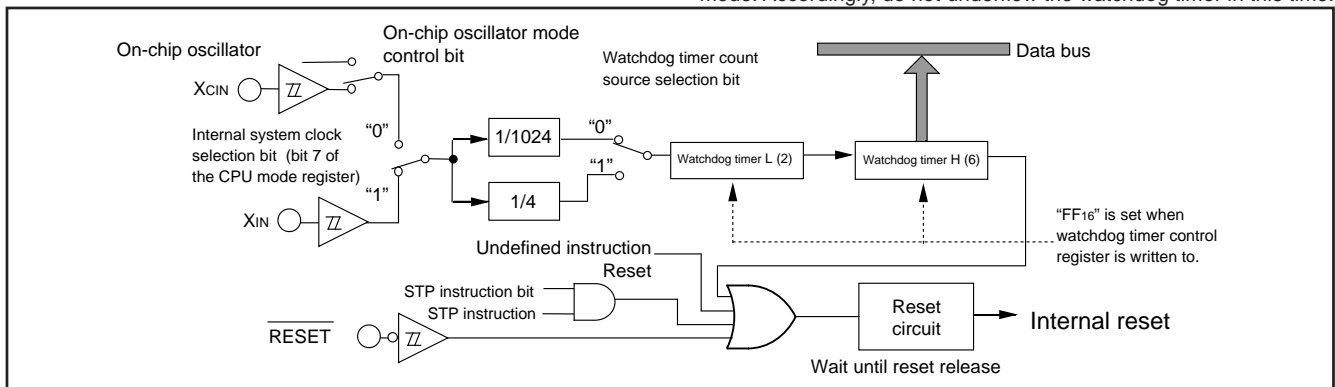

Fig. 47 Block diagram of Watchdog timer

Fig. 48 Structure of Watchdog timer control register

Fig. 49 Timing of reset output

## PERIPHERAL FUNCTION EXTENSION REGISTER

The serial I/O transfer direction can be switched by setting the bit 0 in the peripheral function extension register to "1". This function is valid only when the bit 6 in the serial I/O control register is set to "1" (when the clock synchronous serial I/O is selected). P47 can be selected as the output pin of the clock synchronous serial I/O by setting the bit 1 in the peripheral function extension register to "1". When setting P47 to the SOUT pin, set the bit 7 in the port P4 direction register to "1". This function is valid only when the bit 6 in the serial I/O control register to "1" (when the clock synchronous serial I/O is selected). P-channel output of TxD and SOUT can be disabled by the bits 2 and 3 in the peripheral function extension register. Set the bit 4 in the UART control register to "1" after selecting the pin to disable the P-channel output. XCIN frequency signal can be output from the port P41 by setting the bit 4 in the peripheral function extension register to "1". Set the bit 0 in the  $\phi$  output control register and the bit 1 in the port P4 direction register to "1" to output the XCIN frequency signal.

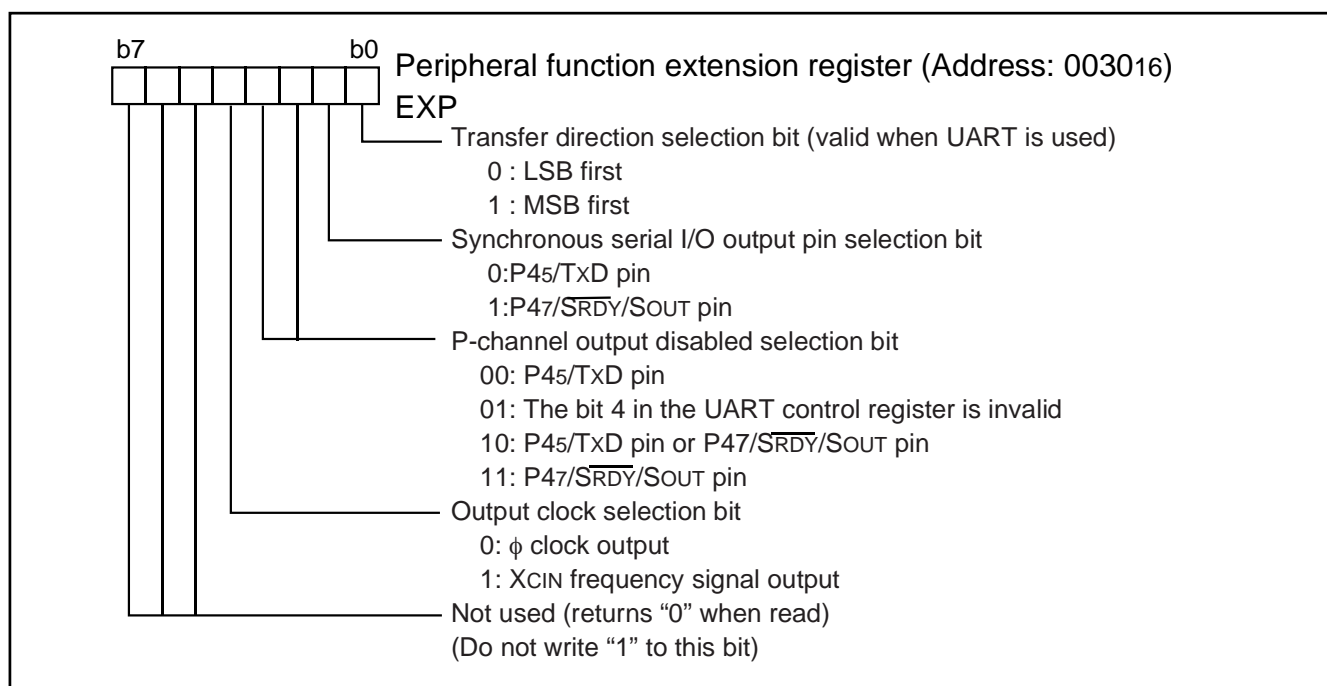

Fig. 50 Structure of peripheral function extension register

## RESET CIRCUIT

To reset the microcomputer,  $\overline{\text{RESET}}$  pin should be held at an "L" level for 2  $\mu\text{s}$  or more. Then the  $\overline{\text{RESET}}$  pin is returned to an "H" level (the power source voltage should be between  $V_{CC}(\text{min.})$  and 5.5 V, and the quartz-crystal oscillator should be stable), reset is released. After the reset is completed, the program starts from the address contained in address  $\text{FFFD}_{16}$  (high-order byte) and address  $\text{FFFC}_{16}$  (low-order byte). Make sure that the reset input voltage meets  $V_{IL}$  spec. when a power source voltage passes  $V_{CC}(\text{min.})$ .

## CLOCK GENERATING CIRCUIT

The 3823 group has two built-in oscillation circuits. An oscillation circuit can be formed by connecting a resonator between XIN and XOUT (XCIN and XCOUT). Use the circuit constants in accordance with the resonator manufacturer's recommended values. The oscillation start voltage and the oscillation start time differ in accordance with an oscillator, a circuit constant, or temperature, etc.

When power supply voltage is low and the high frequency oscillator is used, an oscillation start will require sufficient conditions. No external resistor is needed between XIN and XOUT since a feedback resistor exists on-chip. (an external feed-back resistor may be needed depending on conditions.) However, an external feed-back resistor is needed between XCIN and XCOUT since a resistor does not exist between them.

To supply a clock signal externally, input it to the XIN pin and make the XOUT pin open. The sub-clock XCIN-XCOUT oscillation circuit cannot directly input clocks that are externally generated. Accordingly, be sure to cause an external resonator to oscillate.

Immediately after poweron, only the XIN oscillation circuit starts oscillating, and XCIN and XCOUT pins function as I/O ports.

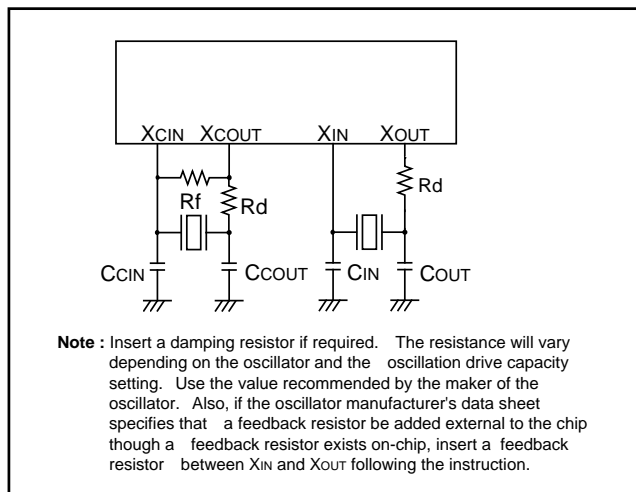

Fig. 54 Ceramic resonator circuit example

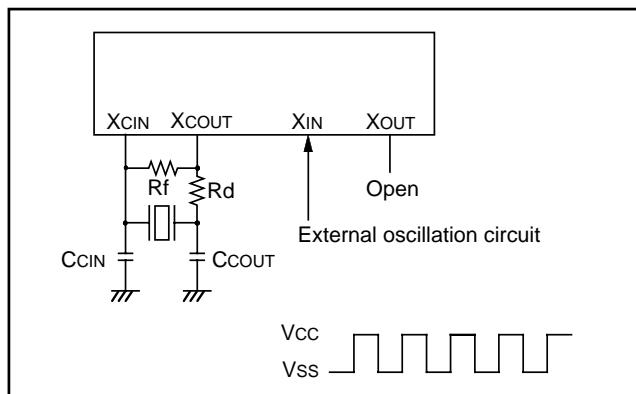

Fig. 55 External clock input circuit

## Frequency Control

### (1) frequency/8 Mode

The internal clock  $\phi$  is the frequency of XIN divided by 8.

After reset, this mode is selected.

### (2) frequency/4 Mode

The internal clock  $\phi$  is the frequency of XIN divided by 4.

### (3) frequency/2 Mode

The internal clock  $\phi$  is half the frequency of XIN.

### (4) Low-speed Mode

- The internal clock  $\phi$  is the frequency of XIN or on-chip oscillation frequency divided by 2.

- A low-power consumption operation can be realized by stopping the main clock XIN in this mode. To stop the main clock, set bit 5 of the CPU mode register to "1".

When the main clock XIN is restarted, set enough time for oscillation to stabilize by programming.

In low speed mode, the system clock  $\phi$  can be switched to the on-chip oscillator or XCIN. Use the on-chip oscillator control bit (bit 0 in the CPU mode expansion register) for settings. To set this bit to "0" from "1", wait until XCIN oscillation stabilizes.

**Note 1:** If you switch the mode between frequency/2/4/8 mode and low-speed, stabilize both XIN and XCIN oscillations.

The sufficient time is required for the sub-clock to stabilize, especially immediately after poweron and at returning from stop mode. When switching the mode between middle/high-speed and low-speed, set the frequency on condition that  $f(XIN) > 3f(XCIN)$ .

**2:** In frequency/2/4/8 mode, XIN-XOUT oscillation does not stop even if the main clock (XIN-XOUT) stop bit is set to "1".

**3:** In low speed mode, XCIN-XCOUT oscillation does not stop even if the port Xc switch bit is set to "0".

## Oscillation Control

### (1) Stop Mode

If the STP instruction is executed, the internal clock  $\phi$  stops at an "H" level, and XIN and XCIN oscillators stop. Timer 1 is set to "FF16" and timer 2 is set to "0116".

Either XIN or XCIN divided by 16 is input to timer 1 as count source, and the output of timer 1 is connected to timer 2. The bits of the timer 123 mode register except bit 4 are cleared to "0". Set the timer 1 and timer 2 interrupt enable bits to disabled ("0") before executing the STP instruction. Oscillator restarts at reset or when an external interrupt is received, but the internal clock  $\phi$  is not supplied to the CPU until timer 2 underflows. This allows timer for the clock circuit oscillation to stabilize.

Execution of the STP instruction sets the LCD enable bit (bit 3 of the LCD mode register) to "0" and the LCD panel turns off. To make the LCD panel turn on after returning from the stop mode, set the LCD enable bit to "1".

### (2) Wait Mode

If the WIT instruction is executed, only the system clock  $\phi$  stops at an "H" state. The states of main clock, on-chip oscillator and sub clock are the same as the state before executing the WIT instruction, and oscillation does not stop. Since supply of system clock  $\phi$  is started immediately after the interrupt is received, the instruction can be executed immediately.

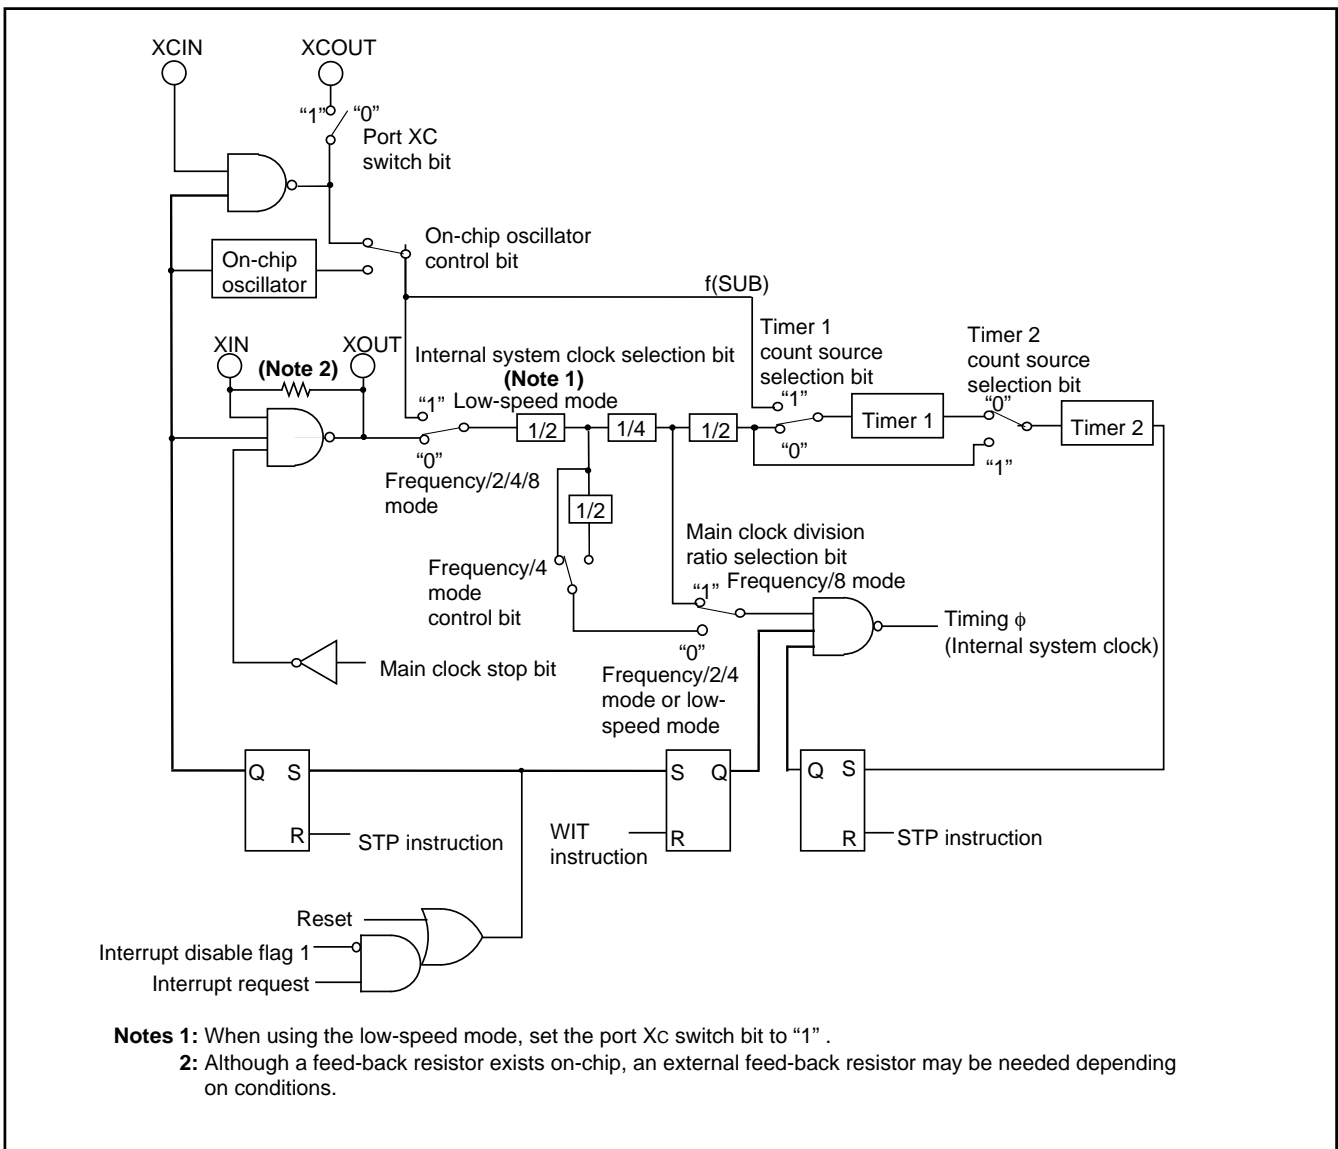

Fig. 56 Clock generating circuit block diagram

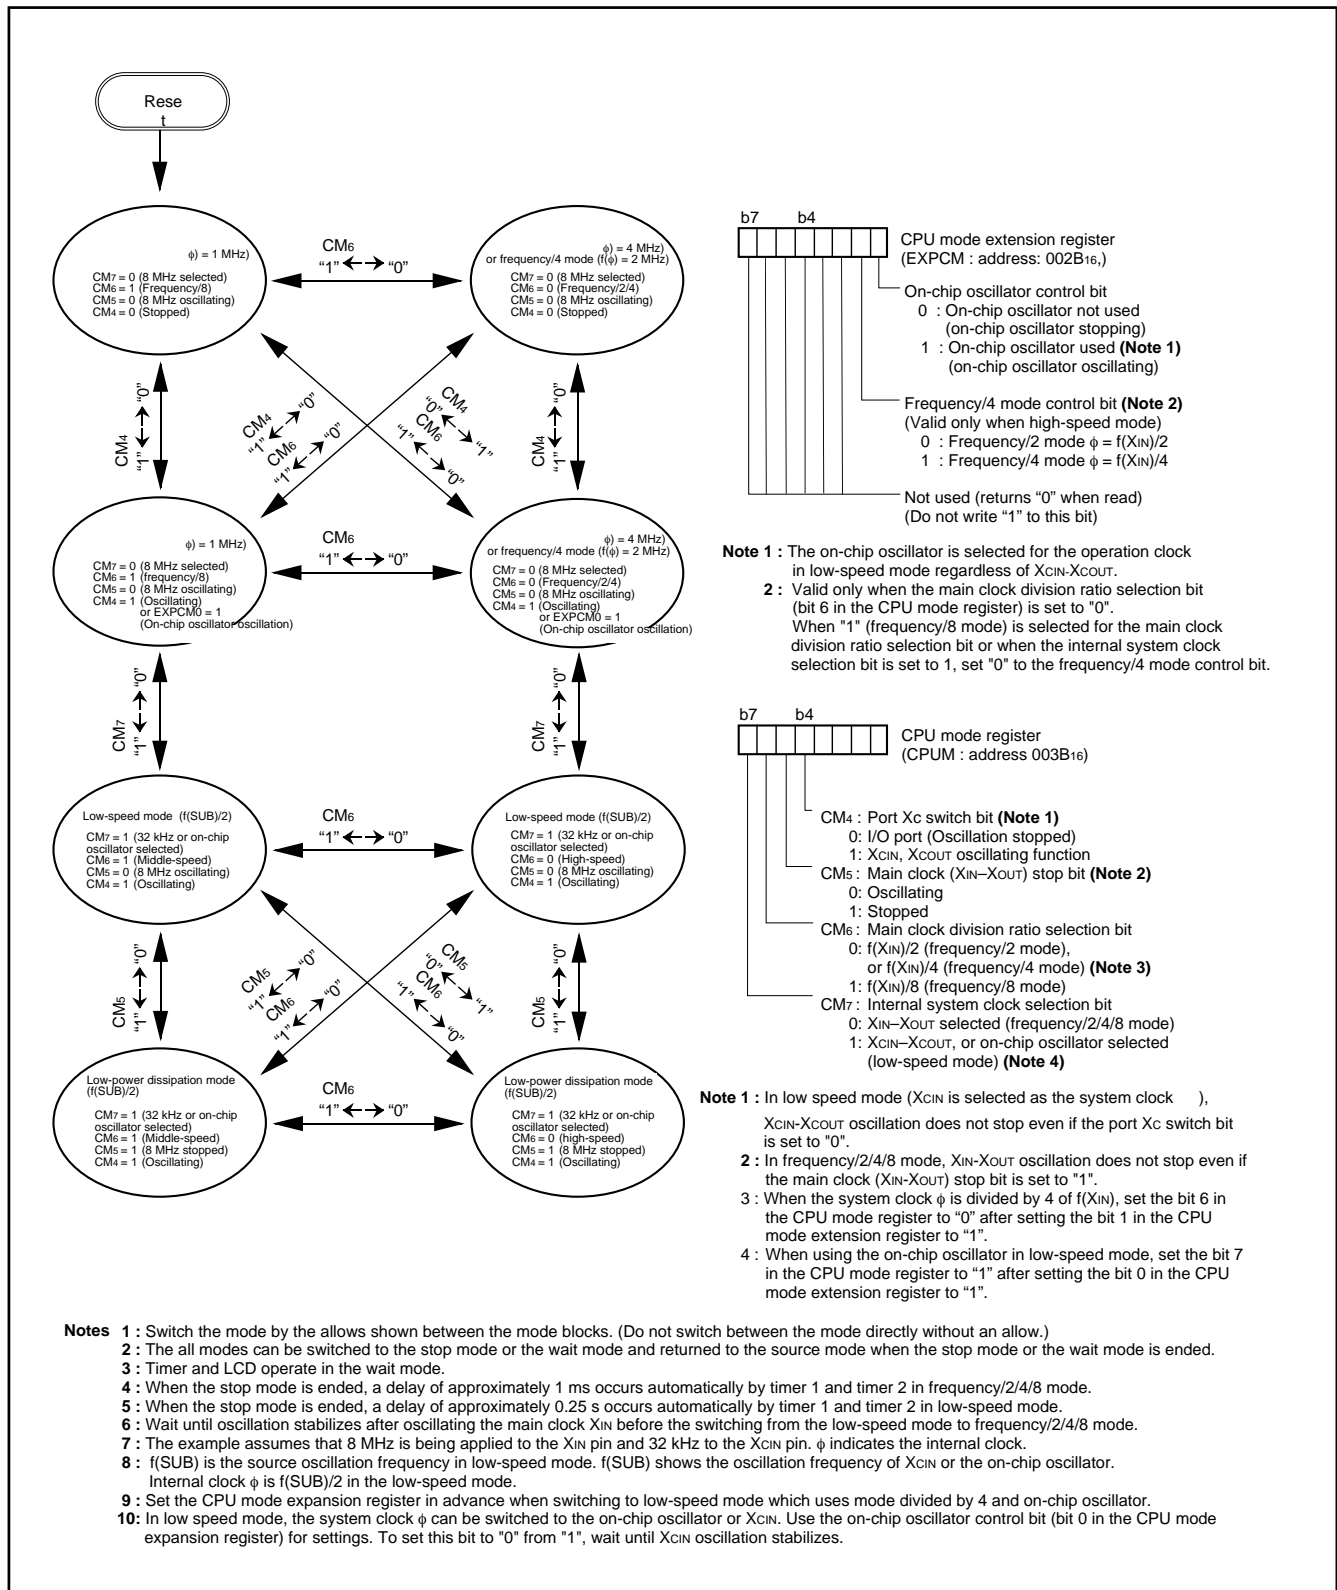

Fig. 57 State transitions of system clock

## QzROM Writing Mode

In the QzROM writing mode, the user ROM area can be rewritten while the microcomputer is mounted on-board by using a serial programmer which is applicable for this microcomputer.

Table 13 lists the pin description (QzROM writing mode) and Figure 58 and Figure 59 show the pin connections.

Refer to Figure 60 and Figure 61 for examples of a connection with a serial programmer.

Contact the manufacturer of your serial programmer for serial programmer. Refer to the user's manual of your serial programmer for details on how to use it.

**Table 13 Pin description (QzROM writing mode)**

Pin	Name	I/O	Function
VCC, VSS	Power source	Input	• Apply 1.8 to 5.5 V to VCC, and 0 V to VSS.
RESET	Reset input	Input	• Reset input pin for active "L". Reset occurs when RESET pin is hold at an "L" level for 16 cycles or more of XIN.
XIN	Clock input	Input	• Set the same termination as the single-chip mode.
XOUT	Clock output	Output	
VREF	Analog reference voltage	Input	• Input the reference voltage of A/D converter to VREF.
AVSS	Analog power source	Input	• Connect AVSS to VSS.
P00 – P07 P10 – P17 P20 – P27 P34 – P37 P41 – P44 P50 – P57 P60 – P67	I/O port	I/O	• Input "H" or "L" level signal or leave the pin open.
P40	VPP input	Input	• QzROM programmable power source pin.
P44	ESDA input/output	I/O	• Serial data I/O pin.
P42	ESCLK input	Input	• Serial clock input pin.
P43	ESPGMB input	Input	• Read/program pulse input pin.

**Fig. 58 Pin connection diagram (M3823XGX-XXXFP)**

**Fig. 59 Pin connection diagram (M3823XGX-XXXHP)**

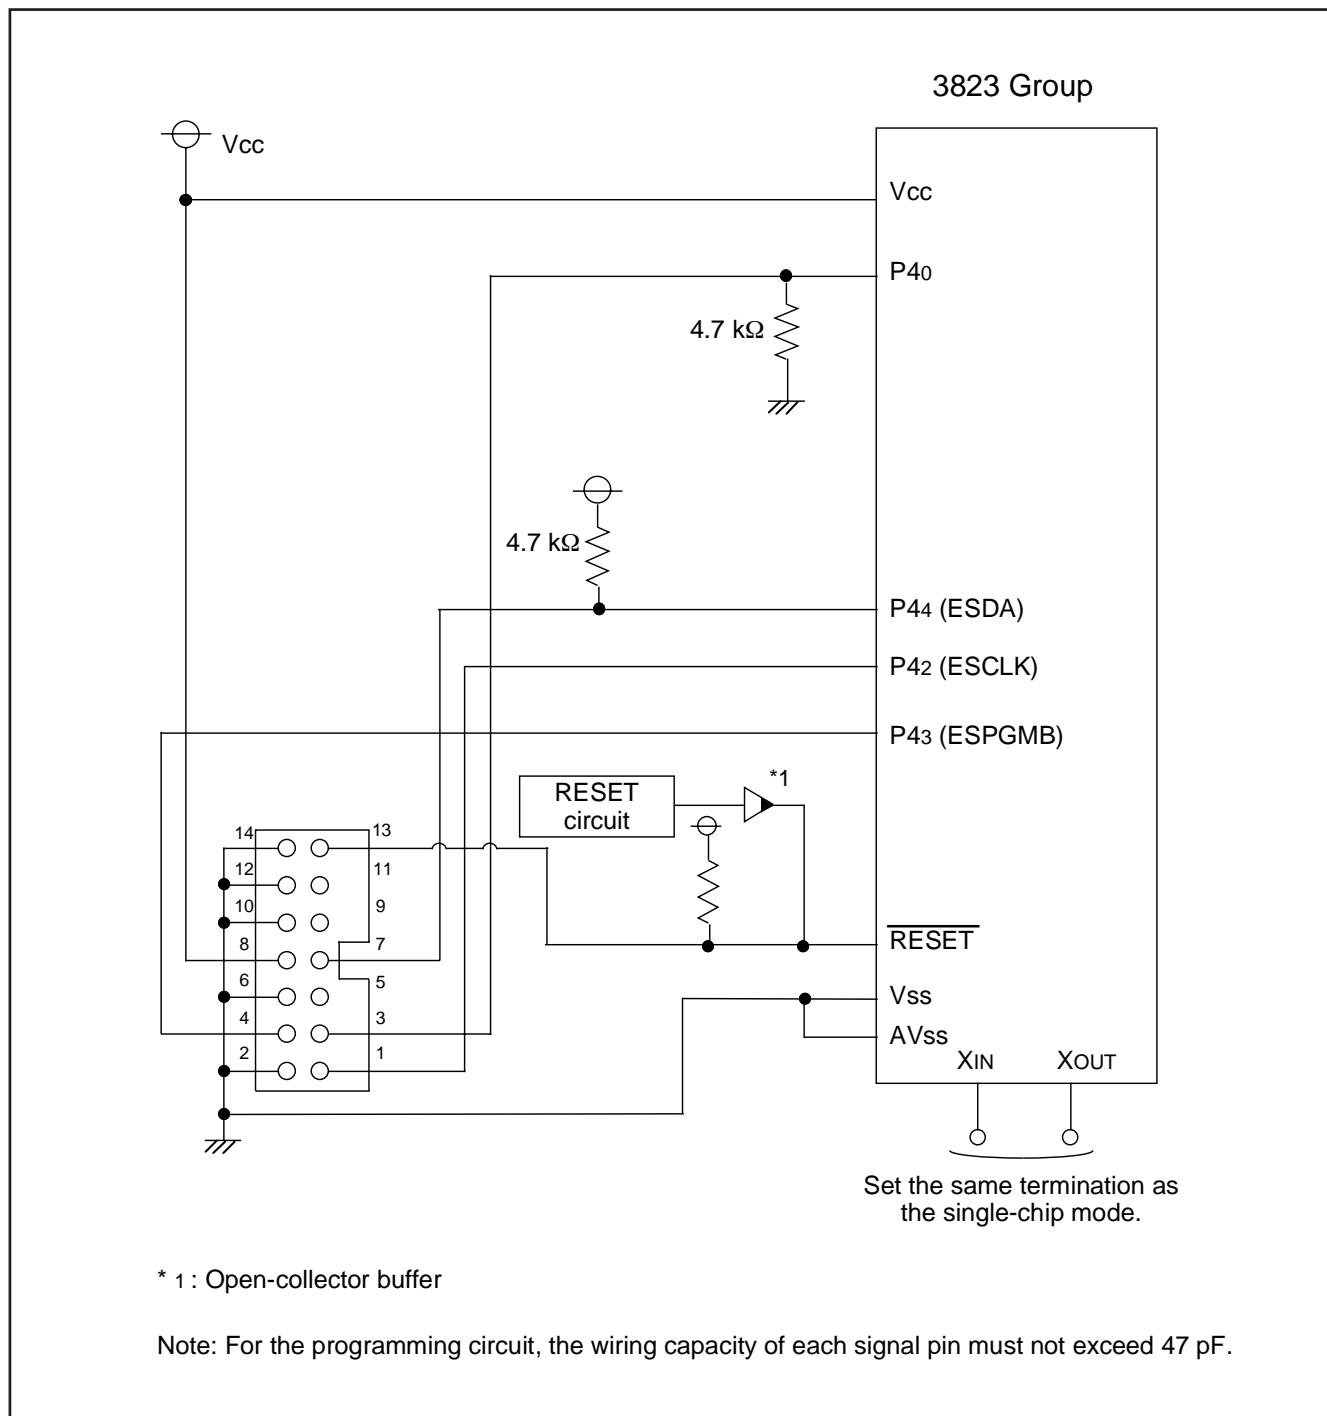

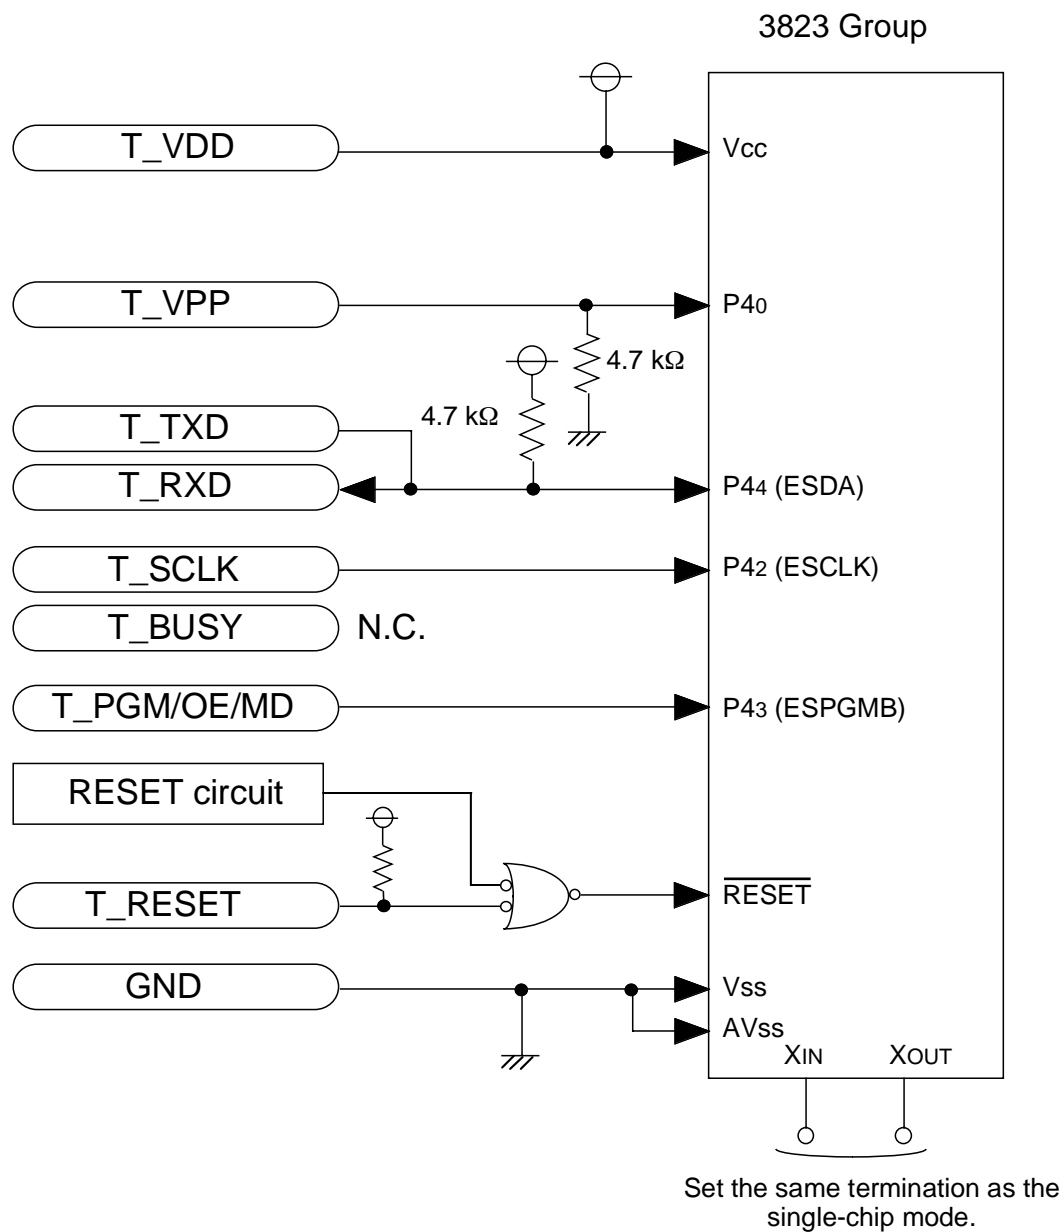

Fig. 60 When using E8 programmer, connection example

Note: For the programming circuit, the wiring capacity of each signal pin must not exceed 47 pF.

Fig. 61 When using programmer of Sisei Electronics System Co., LTD, connection example

## NOTES ON PROGRAMMING

### Processor Status Register

The contents of the processor status register (PS) after a reset are undefined, except for the interrupt disable flag (I) which is "1". After a reset, initialize flags which affect program execution.

In particular, it is essential to initialize the index X mode (T) and the decimal mode (D) flags because of their effect on calculations. Initialize these flags at the beginning of the program.

### Interrupt

The contents of the interrupt request bits do not change immediately after they have been written. After writing to an interrupt request register, execute at least one instruction before performing a BBC or BBS instruction.

### Decimal Calculations

- To calculate in decimal notation, set the decimal mode flag (D) to "1", then execute an ADC or SBC instruction. After executing an ADC or SBC instruction, execute at least one instruction before executing a SEC, CLC, or CLD instruction.
- In decimal mode, the values of the negative (N), overflow (V), and zero (Z) flags are invalid.

### Timers

If a value  $n$  (between 0 and 255) is written to a timer latch, the frequency division ratio is  $1/(n + 1)$ .

### Multiplication and Division Instructions

The index mode (T) and the decimal mode (D) flags do not affect the MUL and DIV instruction.

The execution of these instructions does not change the contents of the processor status register.

### Ports

The contents of the port direction registers cannot be read.

The following cannot be used:

- The data transfer instruction (LDA, etc.)
- The operation instruction when the index X mode flag (T) is "1"
- The addressing mode which uses the value of a direction register as an index
- The bit-test instruction (BBC or BBS, etc.) to a direction register
- The read-modify-write instruction (ROR, CLB, or SEB, etc.) to a direction register

Use instructions such as LDM and STA, etc., to set the port direction registers.

### Serial Interface

In clock synchronous serial I/O, if the receive side is using an external clock and it is to output the  $\overline{\text{SRDY}}$  signal, set the transmit enable bit, the receive enable bit, and the  $\overline{\text{SRDY}}$  output enable bit to "1".

Serial I/O continues to output the final bit from the TxD pin after transmission is completed.

### A/D Converter

The comparator is constructed linked to a capacitor. The conversion accuracy may be low because the charge is lost if the conversion speed is not enough. Accordingly, set  $f(\text{XIN})$  to at least 500kHz during A/D conversion in the middle-or high-speed mode. Also, do not execute the STP or WIT instruction during an A/D conversion.

In the low-speed mode, since the A/D conversion is executed by the on-chip oscillator, the minimum value of  $f(\text{XIN})$  frequency is not limited.

### LCD Drive Control Circuit

Execution of the STP instruction sets the LCD enable bit (bit 3 of the LCD mode register) to "0" and the LCD panel turns off. To make the LCD panel turn on after returning from the stop mode, set the LCD enable bit to "1".

### Instruction Execution Time

The instruction execution time is obtained by multiplying the frequency of the internal clock  $\phi$  by the number of cycles needed to execute an instruction.

The number of cycles required to execute an instruction is shown in the list of machine instructions.

The frequency of the internal clock  $\phi$  is half of the  $\text{XIN}$  frequency.

## Countermeasures against noise

### (1) Shortest wiring length

#### ① Wiring for RESET pin

Make the length of wiring which is connected to the RESET pin as short as possible. Especially, connect a capacitor across the RESET pin and the Vss pin with the shortest possible wiring (within 20mm).

#### ● Reason

The width of a pulse input into the RESET pin is determined by the timing necessary conditions. If noise having a shorter pulse width than the standard is input to the RESET pin, the reset is released before the internal state of the microcomputer is completely initialized. This may cause a program runaway.

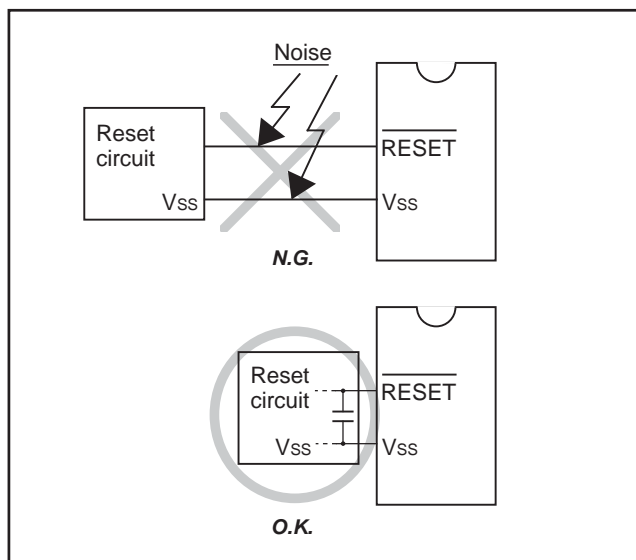

Fig. 62 Wiring for the RESET pin

#### ② Wiring for clock input/output pins

- Make the length of wiring which is connected to clock I/O pins as short as possible.
- Make the length of wiring (within 20 mm) across the grounding lead of a capacitor which is connected to an oscillator and the Vss pin of a microcomputer as short as possible.
- Separate the Vss pattern only for oscillation from other Vss patterns.

#### ● Reason

If noise enters clock I/O pins, clock waveforms may be deformed. This may cause a program failure or program runaway. Also, if a potential difference is caused by the noise between the Vss level of a microcomputer and the Vss level of an oscillator, the correct clock will not be input in the microcomputer.

Fig. 63 Wiring for clock I/O pins

(2) Connection of bypass capacitor across Vss line and Vcc line  
In order to stabilize the system operation and avoid the latch-up, connect an approximately 0.1  $\mu$ F bypass capacitor across the Vss line and the Vcc line as follows:

- Connect a bypass capacitor across the Vss pin and the Vcc pin at equal length.
- Connect a bypass capacitor across the Vss pin and the Vcc pin with the shortest possible wiring.
- Use lines with a larger diameter than other signal lines for Vss line and Vcc line.
- Connect the power source wiring via a bypass capacitor to the Vss pin and the Vcc pin.

Fig. 64 Bypass capacitor across the Vss line and the Vcc line

## (3) Oscillator concerns

In order to obtain the stabilized operation clock on the user system and its condition, contact the oscillator manufacturer and select the oscillator and oscillation circuit constants. Be careful especially when range of voltage and temperature is wide.

Also, take care to prevent an oscillator that generates clocks for a microcomputer operation from being affected by other signals.

## ① Keeping oscillator away from large current signal lines

Install a microcomputer (and especially an oscillator) as far as possible from signal lines where a current larger than the tolerance of current value flows.

## ● Reason

In the system using a microcomputer, there are signal lines for controlling motors, LEDs, and thermal heads or others. When a large current flows through those signal lines, strong noise occurs because of mutual inductance.

## ② Installing oscillator away from signal lines where potential levels change frequently

Install an oscillator and a connecting pattern of an oscillator away from signal lines where potential levels change frequently. Also, do not cross such signal lines over the clock lines or the signal lines which are sensitive to noise.

## ● Reason

Signal lines where potential levels change frequently (such as the CNTR pin signal line) may affect other lines at signal rising edge or falling edge. If such lines cross over a clock line, clock waveforms may be deformed, which causes a microcomputer failure or a program runaway.

Fig. 65 Wiring for a large current signal line/Wiring of signal lines where potential levels change frequently

## (4) Analog input

The analog input pin is connected to the capacitor of a voltage comparator. Accordingly, sufficient accuracy may not be obtained by the charge/discharge current at the time of A/D conversion when the analog signal source of high-impedance is connected to an analog input pin. In order to obtain the A/D conversion result stabilized more, please lower the impedance of an analog signal source, or add the smoothing capacitor to an analog input pin.

## (5) Difference of memory size

When memory size differ in one group, actual values such as an electrical characteristics, A/D conversion accuracy, and the amount of -proof of noise incorrect operation may differ from the ideal values. When these products are used switching, perform system evaluation for each product of every after confirming product specification.

## (6) Wiring to P40/(VPP) pin

When using P40/(VPP) pin as an input port, connect an approximately 5 kΩ resistor to the P40/(VPP) pin the shortest possible in series.

When not using P40/(VPP) pin, connect the pin the shortest possible to the GND pattern which is supplied to the Vss pin of the microcomputer. In addition connecting an approximately 5 kΩ resistor in series to the GND could improve noise immunity. In this case as well as the above mention, connect the pin the shortest possible to the GND pattern which is supplied to the Vss pin of the microcomputer.

## ● Reason

The P40/(VPP) pin of the QzROM version is the power source input pin for the built-in QzROM. When programming in the QzROM, the impedance of the VPP pin is low to allow the electric current for writing to flow into the built-in QzROM. Because of this, noise can enter easily. If noise enters the P40/(VPP) pin, abnormal instruction codes or data are read from the QzROM, which may cause a program runaway.

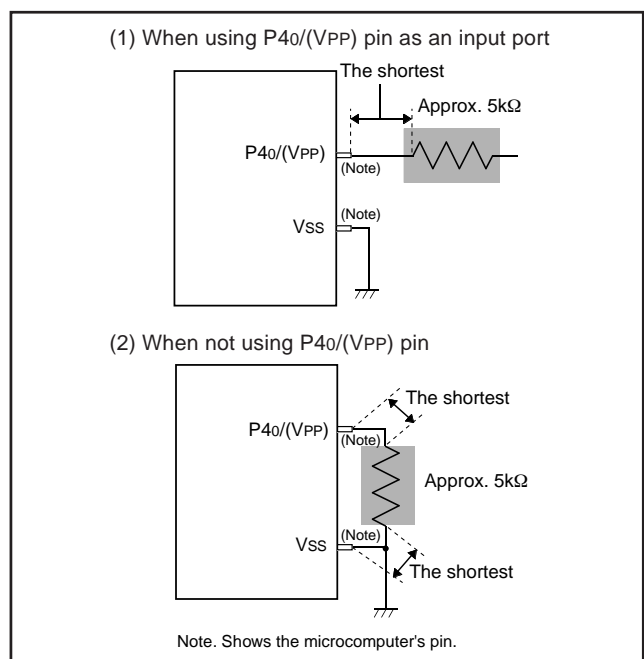

Fig. 66 Wiring for the P40/(VPP) pin

## NOTES ON USE

### Power Source Voltage

When the power source voltage value of a microcomputer is less than the value which is indicated as the recommended operating conditions, the microcomputer does not operate normally and may perform unstable operation.

In a system where the power source voltage drops slowly when the power source voltage drops or the power supply is turned off, reset a microcomputer when the power source voltage is less than the recommended operating conditions and design a system not to cause errors to the system by this unstable operation.

### LCD drive power supply

Power supply capacitor may be insufficient with the division resistance for LCD power supply, and the characteristic of the LCD panel. In this case, there is the method of connecting the bypass capacitor about 0.1–0.33 $\mu$ F to VL1–VL3 pins. The example of a strengthening measure of the LCD drive power supply is shown in Figure 67.

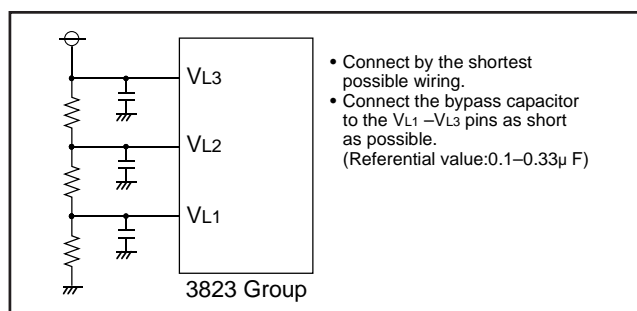

Fig. 67 Strengthening measure example of LCD drive power supply

### Product shipped in blank

As for the product shipped in blank, Renesas does not perform the writing test to user ROM area after the assembly process though the QzROM writing test is performed enough before the assembly process. Therefore, a writing error of approx. 0.1 % may occur. Moreover, please note the contact of cables and foreign bodies on a socket, etc. because a writing environment may cause some writing errors.

### Overvoltage

Make sure that voltage exceeding the Vcc pin voltage is not applied to other pins. In particular, ensure that the state indicated by bold lines in figure below does not occur for pin P40 (VPP power source pin for QzROM) during power-on or power-off. Otherwise the contents of QzROM could be rewritten.

Fig. 68 Timing Diagram (Applies to section indicated by bold line.)

## NOTES ON QzROM

### Notes On QzROM Writing Orders

When ordering the QzROM product shipped after writing, submit the mask file (extension: .msk) which is made by the mask file converter MM.

Be sure to set the ROM option ("MASK option" written in the mask file converter) setup when making the mask file by using the mask file converter MM.

### Notes On ROM Code Protect (QzROM product shipped after writing)

As for the QzROM product shipped after writing, the ROM code protect is specified according to the ROM option setup data in the mask file which is submitted at ordering.

The ROM option setup data in the mask file is "0016" for protect enabled or "FF16" for protect disabled. Therefore, the contents of the ROM code protect address (other than the user ROM area) of the QzROM product shipped after writing is "0016" or "FF16".

Note that the mask file which has nothing at the ROM option data or has the data other than "0016" and "FF16" can not be accepted.

## DATA REQUIRED FOR QzROM WRITING ORDERS

The following are necessary when ordering a QzROM product shipped after writing:

1. QzROM Writing Confirmation Form\*
2. Mark Specification Form\*
3. ROM data.....Mask file

\* For the QzROM writing confirmation form and the mark specification form, refer to the "Renesas Technology Corp." Homepage (<http://www.renesas.com>).

Note that we cannot deal with special font marking (customer's trademark etc.) in QzROM microcomputer.

## ELECTRICAL CHARACTERISTICS

**Table 14 Absolute maximum ratings**

Symbol	Parameter	Conditions	Ratings	Unit
VCC	Power source voltage	All voltages are based on VSS. When an input voltage is measured, output transistors are cut off.	−0.3 to 6.5	V
VI	Input voltage P00–P07, P10–P17, P20–P27, P34–P37, P40–P47, P50–P57, P60–P67, P70, P71		−0.3 to VCC +0.3	V
VI	Input voltage VL1		−0.3 to VL2	V
VI	Input voltage VL2		VL1 to VL3	V
VI	Input voltage VL3		VL2 to 6.5	V
VI	Input voltage RESET, XIN		−0.3 to VCC +0.3	V
VO	Output voltage P00–P07, P10–P17	At output port	−0.3 to VCC +0.3	V
		At segment output	−0.3 to VL3	V
VO	Output voltage P34–P37	At segment output	−0.3 to VL3	V
VO	Output voltage P20–P27, P41–P47, P50–P57, P60–P67, P70, P71		−0.3 to VCC +0.3	V
VO	Output voltage SEG0–SEG11		−0.3 to VL3	V
VO	Output voltage XOUT		−0.3 to VCC +0.3	V
Pd	Power dissipation	Ta = 25°C	300	mW
Topr	Operating temperature		−20 to 85	°C
Tstg	Storage temperature		−40 to 150	°C

**Table 15 Recommended operating conditions (1)**

(VCC = 1.8 to 5.5 V, Ta = −20 to 85 °C, unless otherwise noted)

Symbol	Parameter			Limits			Unit
				Min.	Typ.	Max.	
VCC	Power source voltage ( <b>Note 1</b> )	Frequency/2 mode	f(XIN) = 10 MHz	4.5	5.0	5.5	V

**Table 22 Timing requirements (1)**

(VCC = 4.0 to 5.5 V, VSS = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter		Limits			Unit
			Min.	Typ.	Max.	
tw(RESET)	Reset input "L" pulse width		2			μs
tc(XIN)	Main clock input cycle time (XIN input)	4.0 ≤ Vcc < 4.5 V	1000/(4 × Vcc-8)			ns
		4.5 ≤ Vcc ≤ 5.5 V	100			ns
twH(XIN)	Main clock input "H" pulse width	4.0 ≤ Vcc < 4.5 V	45			ns
		4.5 ≤ Vcc ≤ 5.5 V	40			ns
twL(XIN)	Main clock input "L" pulse width	4.0 ≤ Vcc < 4.5 V	45			ns
		4.5 ≤ Vcc ≤ 5.5 V	40			ns
tc(CNTR)	CNTR0, CNTR1 input cycle time	4.0 ≤ Vcc < 4.5 V	1000/(2 × Vcc-4)			ns
		4.5 ≤ Vcc ≤ 5.5 V	200			ns
twH(CNTR)	CNTR0, CNTR1 input "H" pulse width	4.0 ≤ Vcc < 4.5 V	105			ns
		4.5 ≤ Vcc ≤ 5.5 V	85			ns
twL(CNTR)	CNTR0, CNTR1 input "L" pulse width	4.0 ≤ Vcc < 4.5 V	105			ns
		4.5 ≤ Vcc ≤ 5.5 V	85			ns
twH(INT)	INT0 to INT3 input "H" pulse width		80			ns
twL(INT)	INT0 to INT3 input "L" pulse width		80			ns
tc(SCLK)	Serial I/O clock input cycle time <b>(Note)</b>		800			ns
twH(SCLK)	Serial I/O clock input "H" pulse width <b>(Note)</b>		370			ns
twL(SCLK)	Serial I/O clock input "L" pulse width <b>(Note)</b>		370			ns
tsu(RxD-SCLK)	Serial I/O input set up time		220			ns
th(SCLK-RxD)	Serial I/O input hold time		100			ns

**Note:** When bit 6 of address 001A16 is "1" (clock synchronous).

Divide this limits value by four when bit 6 of address 001A16 is "0" (UART).

**Table 23 Timing requirements (2)**

(VCC = 1.8 to 4.0 V, VSS = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter		Limits			Unit
			Min.	Typ.	Max.	
tw(RESET)	Reset input "L" pulse width		2			μs
tc(XIN)	Main clock input cycle time (XIN input)	2.0 ≤ Vcc ≤ 4.0 V	125			ns
		Vcc < 2.0 V	1000/(10 × Vcc-12)			ns
twH(XIN)	Main clock input "H" pulse width	2.0 ≤ Vcc ≤ 4.0 V	50			ns
		Vcc < 2.0 V	70			ns
twL(XIN)	Main clock input "L" pulse width	2.0 ≤ Vcc ≤ 4.0 V	50			ns
		Vcc < 2.0 V	70			ns
tc(CNTR)	CNTR0, CNTR1 input cycle time	2.0 ≤ Vcc ≤ 4.0 V	1000/Vcc			ns
		Vcc < 2.0 V	1000/(5 × Vcc-8)			ns
twH(CNTR)	CNTR0, CNTR1 input "H" pulse width		tc(CNTR)/2-20			ns
twL(CNTR)	CNTR0, CNTR1 input "L" pulse width		tc(CNTR)/2-20			ns
twH(INT)	INT0 to INT3 input "H" pulse width		230			ns
twL(INT)	INT0 to INT3 input "L" pulse width		230			ns
tc(SCLK)	Serial I/O clock input cycle time <b>(Note)</b>		2000			ns
twH(SCLK)	Serial I/O clock input "H" pulse width <b>(Note)</b>		950			ns
twL(SCLK)	Serial I/O clock input "L" pulse width <b>(Note)</b>		950			ns
tsu(RxD-SCLK)	Serial I/O input set up time		400			ns
th(SCLK-RxD)	Serial I/O input hold time		200			ns

**Note:** When bit 6 of address 001A16 is "1" (clock synchronous).

Divide this limits value by four when bit 6 of address 001A16 is "0" (UART).

**Table 24 Switching characteristics (1)**

(VCC = 4.0 to 5.5 V, VSS = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
twH(SCLK)	Serial I/O clock output "H" pulse width	tc (SCLK)/2-30			ns
twL(SCLK)	Serial I/O clock output "L" pulse width	tc (SCLK)/2-30			ns
td(SCLK-TxD)	Serial I/O output delay time <b>(Note)</b>			140	ns
tv(SCLK-TxD)	Serial I/O output valid time <b>(Note)</b>	-30			ns
tr(SCLK)	Serial I/O clock output rising time			30	ns
tf(SCLK)	Serial I/O clock output falling time			30	ns

**Note** : When the P4s/TxD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is "0".**Table 25 Switching characteristics (2)**

(VCC = 1.8 to 4.0 V, VSS = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
twH(SCLK)	Serial I/O clock output "H" pulse width	tc (SCLK)/2-100			ns
twL(SCLK)	Serial I/O clock output "L" pulse width	tc (SCLK)/2-100			ns
td(SCLK-TxD)	Serial I/O output delay time <b>(Note)</b>			350	ns
tv(SCLK-TxD)	Serial I/O output valid time <b>(Note)</b>	-30			ns
tr(SCLK)	Serial I/O clock output rising time			100	ns
tf(SCLK)	Serial I/O clock output falling time			100	ns

**Note** : When the P4s/TxD P-channel output disable bit of the UART control register (bit 4 of address 001B16) is "0".**Fig. 69 Circuit for measuring output switching characteristics**

Notes:

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (<http://www.renesas.com>)
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guarantees regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
  - (1) artificial life support devices or systems
  - (2) surgical implantations
  - (3) healthcare intervention (e.g., excision, administration of medication, etc.)
  - (4) any other purposes that pose a direct threat to human lifeRenesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.
