### description

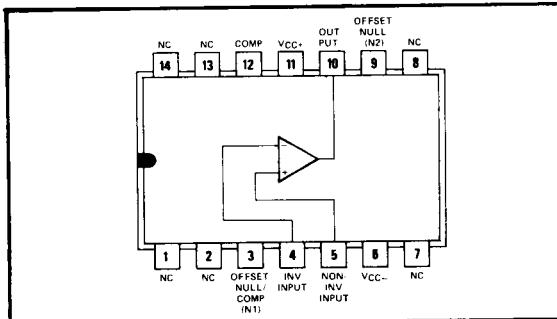

The uA777 is a precision operational amplifier. Low offset and bias currents improve system accuracy when used in applications such as long-term integrators, sample-and-hold circuits, and high-source-impedance summing amplifiers. This device is an excellent choice where a performance between that of super-beta-and general purpose operational amplifiers is required.

External compensation of the uA777 may be implemented in either normal or feed-forward configuration to satisfy bandwidth and slew-rate requirements. This circuit features high gain, wide differential and common-mode input voltage range, output short-circuit protection, and null capability.

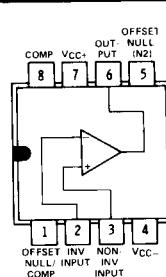

The uA777C is characterized for operation from 0°C to 70°C.

NOTES: 1. All voltage values, unless otherwise noted, are with respect to the midpoint between  $V_{CC+}$  and  $V_{CC-}$ .

2. Differential voltages are at the noninverting input terminal with respect to the inverting input terminal.

3. The magnitude of the input voltage must never exceed the magnitude of the supply voltage or 15 volts, whichever is less.

4. The output may be shorted to ground or either power supply.

5. For operation above 25°C free-air temperature, refer to Dissipation Derating Table. In the J and JG package, uA777C chips are glass-mounted.
