## GREEN MODE PWM CONTROLLER

AP384XG

### General Description

The AP384XG is a Green Mode PWM controller. It is specially designed for off-line AC-DC adapter and battery charger applications where both needs for low standby power and high efficiency in normal operation are required. In a well designed product, the AP384XG is capable to allow the system consuming only 0.5W power in standby mode.

In normal operation, the AP384XG features adjustable frequency by using an external resistor and capacitor combination. When output power falls below a given level, the IC automatically switches to the skip mode, which works by skipping switching cycles. The AP384XG also features low start-up and low standby operating current for its special topology.

The AP384XG provides accurate protection against over-temperature, over-current and maximal output power.

The AP384XG is available in SOIC-8 and DIP-8 packages.

### Features

- Green Mode PWM Controller to Support the "Blue Angel" Norm
- Adjustable Skip Cycle Mode Operation
- Low Start-up Current: 40 $\mu$ A (Typ.)
- Low Standby Operating Current: 6mA
- Internal Leading Edge Blanking
- Adjustable Oscillator Frequency up to 500KHz
- Totem Pole Output
- Under Voltage Lock Out (UVLO)
- Over-Temperature Protection
- Pin to Pin Replacement for AZ384XA

### Applications

- Off-line Converter
- DC-DC Converter
- DVD/STB Power Supply
- Power Adapter
- CRT Monitor Power Supply

### Pin Description

Pin Number	Pin Name	Function
1	COMP	This pin is the Error Amplifier output and is made available for loop compensation.
2	FB	The inverting input of the Error Amplifier. It is normally connected to the switching power supply output through an external resistor divider.
3	CS	It is used either for current sense (normal mode) or skip cycle level selection (standby mode).
4	R <sub>T</sub> /C <sub>T</sub>	The oscillator frequency and maximum output duty cycle are programmed by connecting resistor R <sub>T</sub> to REF and capacitor C <sub>T</sub> to ground.
5	GND	The ground pin.
6	OUTPUT	This output directly drives the gate of a power MOSFET. Peak currents up to 1.0 A are sourced and sunk by this pin.
7	VCC	The power supply pin.
8	REF	This is the reference output. It provides charging current for capacitor C <sub>T</sub> through resistor R <sub>T</sub> .

Power Dissipation at T <sub>A</sub> <25 °C (SOIC-8)	P <sub>D</sub> (Note 3)	460	mW
Storage Temperature Range	T <sub>STG</sub>	-65 to 150	°C
Ambient Temperature	T <sub>A</sub>	-40 to 85	°C
Lead Temperature (Soldering, 10sec)	T <sub>LEAD</sub>	+300	°C
ESD (Machine Model)		300	V

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: All voltages are with respect to pin GND and all currents are positive into specified terminal.

Note 3: Board thickness 1.6mm, board dimension 90mm X 90mm.

## Electrical Characteristics (Continued)

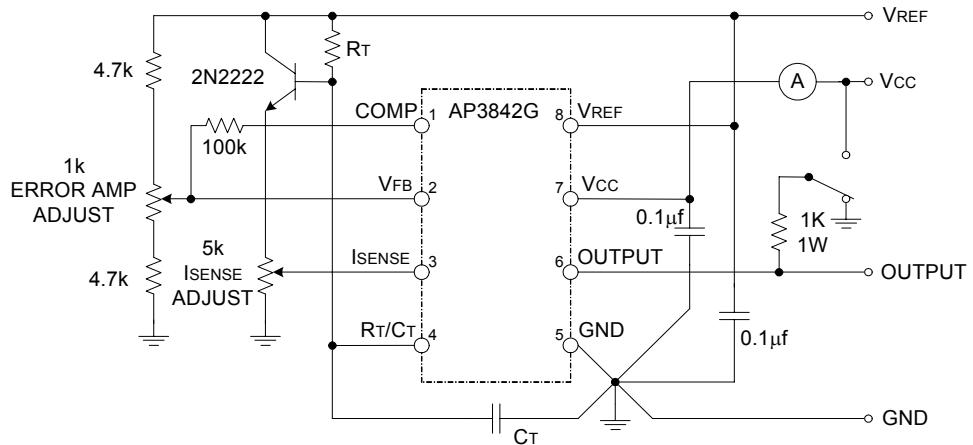

Figure 4. Basic Test Circuit

Figure 4 is the basic test circuit for AP384XG. In testing, the high peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5k potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.
