## LV5026M — Bi-CMOS IC LED Driver IC

### Overview

LV5026M is a High voltage LED drive controller which drives LED current up to 3A with external MOSFET.

LV5026M is realized very simple LED circuits with a few external parts. It corresponds to various wide dimming controls including the TRIAC dimming control.

Note) This LV5026M is designed or developed for general use or consumer appliance. Therefore, it is NOT permitted to use for automotive, communication, office equipment, industrial equipment.

### Functions

- High voltage LED controller
- Various Dimming Control
  - TRIAC & Analog Input & PWM Input
- Soft Start function
- Built-in TRIAC stabilized function
- Built-in circuit of detection of overvoltage of CS pin.
- Selectable Switching frequency [50kHz or 70kHz, open: 50kHz]
- Short protection circuit
- Selectable reference Voltage
  - Internal 0.605V & External Input Voltage
- Low noise switching system/skip frequency function
  - 5 stages skip mode Frequency
  - Soft driving

### Specifications

**Maximum Ratings** at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum input voltage	V <sub>IN</sub> max (Note1)		-0.3 to 42	V
REF_OUT, REF_IN, RT, CS, PWM_D, ACS			-0.3 to 7	V
OUT1 pin	V <sub>OUT_abs</sub>		-0.3 to 42	V
OUT2 pin	V <sub>OUT2_abs</sub>		-0.3 to 42	V
Allowable power dissipation	Pd max	With specified board*	1.0	W

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment. The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for new introduction or other application different from current conditions on the usage of automotive device, communication device, office equipment, industrial equipment etc., please consult with us about usage condition (temperature, operation time etc.) prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Continued from preceding page.

Parameter	Symbol	Conditions	Ratings	Unit
Junction temperature	Tj		150	°C
Operating junction temperature	Topj (Note2)		-30 to +125	°C
Storage temperature	Tstg		-40 to +150	°C

\*1 Specified board: 58.0mm x 54.0mm x 1.6mm (glass epoxy board)

Note1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.

Note2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

## Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Input voltage	V <sub>IN</sub>		8.5 to 24	V

\* Note : supply the stabilized voltage.

## Electrical Characteristics at Ta = 25°C, V<sub>IN</sub> = 12V, unless otherwise specified.

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Reference voltage block

## Pin Functions

Pin No.	Pin name	Pin function	Equivalent circuit
1	RT	Switching frequency selection pin. L or Open : 50kHz switching, H: 70 kHz switching. In case of 70kHz,connect RT pin to REFOUT pin. on time	
2	REF_OUT	Built-in 3V Regulate out Pin. If this function isn't used, please connect to nothing.	
3	REF_IN	External LED current Limit Setting pin. If less than VREF (0.61V) voltage is input, Peak current value is used at the input voltage. If more than REF_IN voltage is input, it is done at VREF voltage. If this function isn't used, please connect nothing.	
4	CS	LED current sensing in. If this terminal voltage exceeds VREF (Or REF_IN), external FET is OFF. And if the voltage of the terminal exceeds 1.9V, LV5026M turns to latch-off mod	
5	PWM_D	PWM Dimming pin.L or open: normal operation, H: Stop operation.	
6	GND	GND pin.	
7	OUT	Driving the external FET Gate Pin.	
8	VIN	Power supply pin. Operation : $V_{IN} > UVLOON$ Stop: $V_{IN} < UVLOFF$ Switching Stop : $V_{IN} > V_{INOV}$	
9	OUT2	This pin drive the FET which is stabilized the TRIAC dimming application. If ACS is less than 3V, OUT2 turn High voltage. If this function isn't used, please connect nothing.	
10	ACS	ACS pin senses AC Voltage. If this function isn't used, please connect GND.	

## LED current and inductance setting

### • Relation ship between REF\_IN and CS pin voltage(Power Factor Crrrection(PFC))

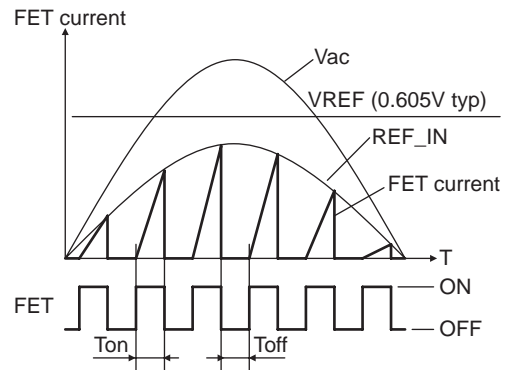

The output current value is the average of the current value that flows during one cycle. The current value that flows into coil is a triangular wave shown in the figure below. Make sure to set  $I_{pk}$  so that (average of current value at one cycle) is equal to (LED current value).  $I_{pk}$  is set by the relationship between REF\_IN voltage and  $R_{cs}$  voltage.

This relationship make Power Factor Correction (PFC). Therefore, it is available to make LED current a sine curve.

### • Setting Zener voltage

$V_{zd}$  depend on LED voltage ( $V_f$ ). Choose Zener diode around  $V_f$  (LED voltage). When VAC voltage is lower than  $V_f$ , LED operation is not normal. Using Zener diode prevents incorrect operating during VAC voltage lower than  $V_f$ . In detail, refer to [LED current and inductance setting]

In case of REF\_IN pin open, this error amplifier negative input(-) is under control of internal VREF voltage (0.605V typ).

$$I_{pk} = \frac{(V_{ac} - V_{zd}) \times \frac{R_2}{R_1 + R_2}}{R_{cs}}$$

$I_{pk}$ : peak inductor current  
 $V_f$ : LED forward voltage drop  
 $V_{ac}$ : effective value, R.M.S value  
 $V_{REF}$ : Built-in reference voltage (0.605V)  
 $V_{REF\_IN}$ : REF\_IN voltage (6 pin)  
 $R_s$ : External sense resistor  
 $V_{zd}$ : Zener diode voltage (REF\_IN pin)

## LED current and inductance setting

It is available to use both no-isolation and isolation applications.

(For non-isolation application)

The output current value is the average of the current value that flows during one cycle. The current value that flows into coil is a triangular wave shown in the figure below. Make sure to set IL\_PK so that (average of current value at one cycle) is equal to (LED current value).

Given that the period when current flows into coil is

$$\text{DutyI} = \frac{T_c + T_d}{T}$$

$$Ip_k \times \frac{1}{2} \times (\text{Duty} \times T) / T = I_{LED}$$

$$Ip_k \times \frac{2 \times I_{LED}}{\text{DutyI}} \quad (1) \text{ since } Ip_k \times \frac{V_{REF\_IN}}{R_{cs}}$$

$$R_{cs} \times \frac{V_{FEF\_IN}}{Ip_k} = \frac{\text{DutyI} \times V_{FEF\_IN}}{2I_{LED}} \quad (2)$$

Ip\_k: peak inductor current  
Vf: LED forward voltage drop  
Vac: effective value(R.M.S value)  
VREF: Built-in reference voltage (0.605V)  
VREF\_IN: REF\_IN voltage (6 pin)  
Rs: External sense resistor  
Vzd: Zener diode voltage (REF\_IN pin)

Since formula for LED current is different between on period and off period as shown above,

$$Ip_k \times \frac{Vac - Vf}{L} \times T_c = \frac{Vf}{L} \times T_d \quad (3)$$

$$\text{Since } T_c + T_d = \text{DutyI} \times T, T_c = \text{DutyI} \times T - T_d \quad (4)$$

$$\text{Based on the result of (3) and (4), } T_d = \text{DutyI} \times T \times \frac{Vac - Vf}{Vac} \quad (5)$$

To obtain L from the equation (1), (3), (5),

$$L \times \frac{Vf \times \text{DutyI}}{2 \times I_{LED}} \times \text{DutyI} \times T = \frac{Vac - Vf}{Vac} = \frac{Vf}{2 \times I_{LED}} \times \frac{1}{f_{osc}} \times \frac{Vac - Vf}{Vac} \times (\text{DutyI})^2 \quad (6)$$

Since LED and inductor are connected in serial in non-isolation mode, LED current flows only when AC voltage exceed VF.

Given that the ratio of inductor current to AC input is DutyAC.

$$DutyAC = \frac{90 - \arcsin\left(\frac{V_f}{\sqrt{2} V_{rms}}\right)}{90}$$

Since the period when the inductor current flows are limited by DutyAC, the formula (6) is represented as follows:

$$L = \frac{V_f}{2 \times I_{LED}} \times \frac{1}{f_{osc}} \times \frac{V_{ac} - V_f}{V_{IN}} \times (DutyI)^2 \times \left( \frac{90 - \arcsin\left(\frac{V_f}{\sqrt{2} V_{rms}}\right)}{90} \right)^2 \quad (7)$$

(for Isolation circuit)

Using the circuit diagram below, the wave form of the current that flows to Np and Ns is as follows.  
Current waveform flows to primary side and secondary.

[Inductance  $L_p$  of primary side and sense resistor  $R_s$ ]

If a peak current flow to transformer is represented as  $I_{pk\_p}$ , the power ( $P_{in}$ ) charged to the transformer on primary side can be represented as:

$$P_{in} = \frac{1}{2} \times L_p \times (I_{pk\_p})^2 \times f_{osc} \quad (11)$$

$$I_{pk\_p} = \frac{V_{vac}}{L_p} \times T_{on\_p} \quad (12)$$

$$L_p = \frac{V_{vac}^2 \times T_{on\_p}^2 \times f_{osc}}{2 \times P_{in}} = \frac{V_{vac}^2 \times D_{on\_p}^2}{2 \times P_{in} \times f_{osc}} \quad (13)$$

$$(D_{on\_p} = \frac{T_{on\_p}}{T} = T_{on\_p} \times f_{osc}),$$

To substitute the following to the formula below,

$$\therefore \eta = \frac{P_{out}}{P_{in}} \quad (14)$$

$$\therefore L_p = \frac{V_{vac}^2 \times T_{on\_p}^2 \times f_{osc} \times \eta}{2 \times P_{out}} = \frac{V_{vac}^2 \times D_{on}^2 \times \eta}{2 \times P_{out} \times f_{osc}} \quad (15)$$

Sense resistor is obtained as follows.

$$R_s = \frac{V_{REF\_IN}}{I_{pk\_p}} = \frac{V_{REF\_IN} \times L_p}{V_{ac} \times T_{on\_p}} = \frac{V_{REF\_IN} \times L_p}{V_{ac} \times Don\_p \times T} \quad (16)$$

[Inductance  $L_s$  of secondary side]

Since output current  $I_{out}$  is the average value of current flows to transformer of secondary side

$$I_{out} = I_{pk\_s} \times \frac{T_{on\_s}}{T} \times \frac{1}{2} = \frac{I_{pk\_s} \times Don\_s}{2} \quad (Don\_s = \frac{T_{on\_s}}{T} = T_{on\_s} \times f_{osc}) \quad (17)$$

$$I_{pk\_s} = \frac{V_{out}}{L_s} \times T_{on\_s} = \frac{V_{out}}{L_s} = \frac{Don\_s}{f_{osc}} \quad (18)$$

$$L_s = \frac{V_{out} \times T \times Don\_s^2}{2 \times I_{out}} = \frac{V_{out} \times Don\_s^2}{2 \times I_{out} \times f_{osc}} = \frac{V_{out}^2 \times Don\_s^2}{2 \times P_{out} \times f_{osc}} \quad (19)$$

Calculation of the ratio of transformer coil on primary side and secondary side

Since ratio and inductance of transformer coil is

$$\frac{N_s}{N_p} = \frac{\sqrt{L_s}}{\sqrt{L_p}} \quad (20)$$

substituted equations (15), (19) for (20)

$$\therefore \frac{N_p}{N_s} = \frac{V_{ac}}{V_{out}} \times \sqrt{\eta} \times \frac{Don\_p}{Don\_s} \quad (21)$$

Calculation of transformer coil on primary side and secondary side

$$N = \frac{V_{ac} \times 10^8}{2 \times \Delta B \times A_e \times f_{osc}} \quad (22)$$

$\Delta B$ : variation range of core flux density [Gauss]

$A_e$ : core section area [cm<sup>2</sup>]

To use  $Al$  (L value at 100T),

$$N = \sqrt{\frac{L}{Al}} \times 10^2 \quad (23)$$

L: inductance [ $\mu$ H]

$Al$ : L value at 100T [ $\mu$ H/N<sup>2</sup>]

lg (Air gap) is obtained as follows:

$$lg = \frac{\mu_r \mu_0 N^2 A_e 10^2}{L} \quad (24)$$

$\mu_r$ : relative magnetic permeability,  $\mu_r = 1$

$\mu_0$ : vacuum magnetic permeability  $\mu_0 = 4\pi \times 10^{-7}$

N: turn count [T]

$A_e$ : core section area [m<sup>2</sup>]

L: inductance [H]

## Bleeder current cuircuit for TRIAC dimmer

### 1. Operating voltage setting

ACS pin voltage set operating voltage at OUT2. ACS pin threshold voltage is 3V typ.

OUT2 operating voltage is set by R1 and R2. R1 and R2 is determined below.

$$ACS = Vac \times \frac{R2}{R1+R2}$$

### 2. Bleeder current setting

Rd set hold current at Triac dimmer.

Bleeder current is set at Rd depending on Triac dimmer.

a blockdiagram in outline

a blockdiagram in outline

Description of operation  
protection function

	tilte	outline	monitor point	note
1	UVLO	Under voltage lock out	V <sub>CC</sub> voltage	
2	OCP	Over current protection	CS voltage	available FET current
3	OVP	Over voltage protection	V <sub>CC</sub> voltage	
4	OTP (TSD)	Over Temperature Protection (Thermal Shut Down)	PN Junction temperature	

1. UVLO (Under voltage lock out)

If V<sub>IN</sub> voltage is 7.3V or lower, then UVLO operates and the IC stops. When UVLO operates, the power supply current of the IC is about 80μA or lower. If V<sub>IN</sub> voltage is 9V or higher, then the IC starts switching operation.

2. UVLO (Under voltage lock out)

The CS pin sense the current through the MOS FET switch and the primary side of the transformer. This provides an additional level of protection in the event of a fault. If the voltage of the CS pin exceeds VCSOCP (1.9V typ) (A), the internal comparator will detect the event and turn off the MOSFET. The peak switch current is calculated  $I_o \text{ (peak) [A]} = VSOCP \text{ [V]} / R_{sense} \text{ [}\Omega\text{]}$

The V<sub>CC</sub> pin is pulled down to fixed level, keeping the controller latched off. The lach reset occurs when the user disconnects LED from V<sub>AC</sub> and lets the V<sub>CC</sub> falls below the V<sub>CC</sub> reset voltage, UVLOOFF (7.3V typ)(B). Then V<sub>CC</sub> rise UVLOON (9V typ) (C), restart the switching.

### 3. OVP (Over voltage protection)

If the voltage of  $V_{IN}$  pin is higher than the internal reference voltage  $V_{INOVP}$  (27V typ), switching operation is stopped.

The stopping operation is kept until the voltage of  $V_{IN}$  is lower than 7.3V. If the voltage of  $V_{IN}$  pin is higher than 9V, the switching operation is restated.

### 4. TSD (Thermal shut down protection)

The thermal shutdown function works when the junction temperature of IC is 165°C (typ) (A), and the IC switching stops. The IC starts switching operation again when the junction temperature is 135°C typ (B) or lower.

### Skip frequency function

LV5026M contains the skip frequency function for reduction of the peak value of conduction noise. This function changes the frequency as follows.

Switching frequency is changed as follows.

...  $\times 0.9 \rightarrow \times 1.1 \rightarrow \times 1.05 \rightarrow \times 1 \rightarrow \times 0.95 \rightarrow \times 0.9 \rightarrow \times 1.1$  ...

It's repeated by this loop.

## PWM dimmer function

LED current can be adjusted according to Duty of PWM pulse input to PWM dimmer pin. PWM pulse is High (2V to 5V) then switching operation stops, and LED current stops flowing. PWM pulse is Low (under 0.6V), then switching operation stop is released, and it returns to normal operation.

### An outline of PWM\_D pin

### LED current vs PWM\_D duty (outline)
