

Typical Applications

Transmit & Receive
Switch for 2.4 GHz Applications:

- Bluetooth
- HomeRF
- WLAN Radios

Features

Tx Gain: 15 dB, Rx Gain: 13 dB
Tx 1 dB Compression Point: 5 dBm
Rx Noise Figure: 3 dB @ 2.4 GHz
Single Positive Supply: +3V
No External Matching Required

Functional Diagram

General Description

The HMC310MS8G & HMC310MS8GE are multi-function RFICs that incorporate a power amplifier (PA) and low noise amplifier (LNA) with a transmit/receive switch. These RFICs offer 15 dB gain and +5 dBm P1dB in the transmit mode and 13 dB of gain with an overall noise figure of 3 dB when in receive mode. Transmit and receive performance levels have been selected to meet the BLUETOOTH Class 2 & 3 requirements when used in conjunction with 2.4 GHz ASICs such as National Semiconductor's LMX3162. This low current and low cost transceiver requires no external circuitry to operate the amplifier power down features, and is available in the industry standard MSOP8G package, which is 0.118" x 0.190" (3.0mm x 4.9mm).

Electrical Specifications, $T_A = +25^\circ \text{C}$, $V_{dd} = +3\text{V}$

Evaluation PCB

Note:
DC blocking capacitors on the Tx and ANT ports are required to evaluate this part. These capacitors may not be required in the final circuit design if interfacing components are DC blocked.

[2] Circuit Board Material: Rogers 4350

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and backside ground slug should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
