## CY23FP12-002

### 200-MHz Field Programmable Zero Delay Buffer

#### Features

- Pre-programmed Configurations
- Fully field-programmable
  - Input and output dividers
  - Inverting/noninverting outputs
  - Phase-locked loop (PLL) or fanout buffer configuration
- 10-MHz to 200-MHz operating range
- Split 2.5V or 3.3V outputs
- Two LVC MOS reference inputs
- Twelve low-skew outputs
  - Output-output skew < 200 ps
  - Device-device skew < 500 ps
- Input-output skew < 250 ps
- Cycle-cycle jitter < 100 ps (typical)
- Three-stateable outputs
- < 50- $\mu$ A shutdown current
- Spread Aware™
- 28-pin SSOP
- 3.3V operation
- Industrial temperature available

#### Functional Description

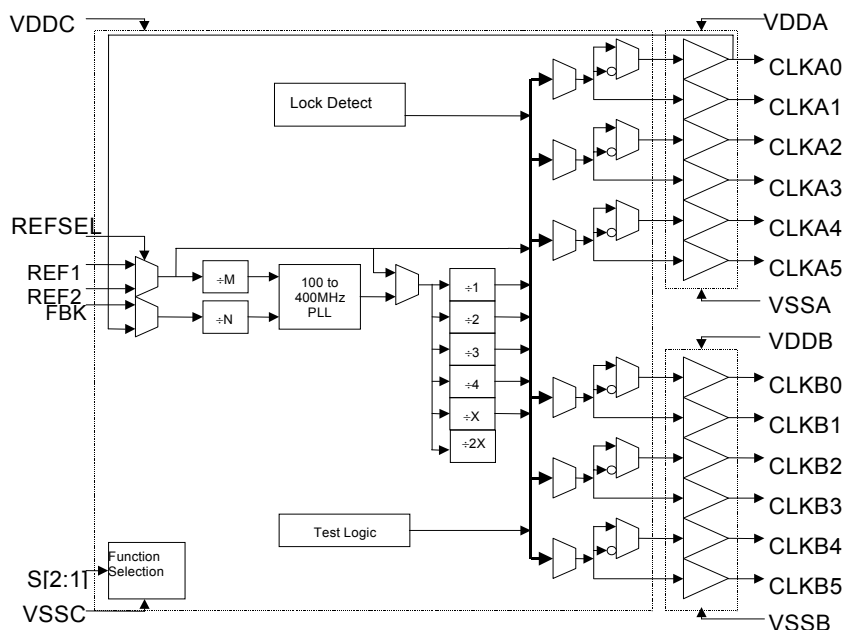

The CY23FP12-002 is a pre-programmed version of the CY23FP12. It features a high-performance fully field-programmable 200 MHz zero delay buffer designed for high speed clock distribution. The integrated PLL is designed for low jitter and optimized for noise rejection. These parameters are critical for reference clock distribution in systems using high-performance ASICs and microprocessors.

The CY23FP12-002 is fully programmable via volume or prototype programmers enabling the user to define an application-specific Zero Delay Buffer with customized input and output dividers, feedback topology (internal/external), output inversions, and output drive strengths. For additional flexibility, the user can mix and match multiple functions, listed in Table 2, and assign a particular function set to any one of the four possible S1-S2 control bit combinations. This feature allows for the implementation of four distinct personalities, selectable with S1-S2 bits, on a single programmed silicon. The CY23FP12-002 also features a proprietary auto-power-down circuit that shuts down the device in case of a REF failure, resulting in less than 50  $\mu$ A of current draw.

The CY23FP12-002 provides twelve outputs grouped in two banks with separate power supply pins which can be connected independently to either a 2.5V or a 3.3V rail.

Selectable reference input is a fault tolerance feature which allows for glitch-free switch over to secondary clock source when REFSEL is asserted/de-asserted.

**Pin Description**

Pin	Name	I/O	Type	Description
1	REF2	I	LVTTL/LVCMOS	Input reference frequency, 5V-tolerant input.
2	REF1	I	LVTTL/LVCMOS	Input reference frequency, 5V-tolerant input.
3	CLKB0	O	LVTTL	Clock output, Bank B.
4	CLKB1	O	LVTTL	Clock output, Bank B.
5	V <sub>SSB</sub>	PWR	POWER	Ground for Bank B.
6	CLKB2	O	LVTTL	Clock output, Bank B.
7	CLKB3	O	LVTTL	Clock output, Bank B.
8	V <sub>DDB</sub>	PWR	POWER	2.5V or 3.3V supply, Bank B.
9	V <sub>SSB</sub>	PWR	POWER	Ground for Bank B.
10	CLKB4	O	LVTTL	Clock output, Bank B.
11	CLKB5	O	LVTTL	Clock output, Bank B.
12	V <sub>DDB</sub>	PWR	POWER	2.5V or 3.3V supply, Bank B.
13	V <sub>DDC</sub>	PWR	POWER	3.3V core supply.
14	S2	I	LVTTL	Select input.
15	S1	I	LVTTL	Select input.
16	V <sub>SSC</sub>	PWR	POWER	Ground for core.
17	V <sub>DDA</sub>	PWR	POWER	2.5V or 3.3V supply, Bank A.
18	CLKA5	O	LVTTL	Clock output, Bank A.
19	CLKA4	O	LVTTL	Clock output, Bank A.
20	V <sub>SSA</sub>	PWR	POWER	Ground for Bank A.
21	V <sub>DDA</sub>	PWR	POWER	2.5V or 3.3V supply Bank A.
22	CLKA3	O	LVTTL	Clock output, Bank A.
23	CLKA2	O	LVTTL	Clock output, Bank A.
24	V <sub>SSA</sub>	PWR	POWER	Ground for Bank A.
25	CLKA1	O	LVTTL	Clock output, Bank A.
26	CLKA0	O	LVTTL	Clock output, Bank A.
27	FBK	I	LVTTL	PLL feedback input.
28	REFSEL	I	LVTTL	Reference select input. REFSEL = 0, REF1 is selected. REFSEL = 1, REF2 is selected.

**Figure 1. Basic PLL Block Diagram**

Below is a list of independent functions that can be programmed with a volume or prototype programmer on the “pre-programmed” silicon.

Table 1.

Configuration	Description	Default
DC Drive Bank A	Programs the drive strength of Bank A outputs. The user can select one out of two possible drive strength settings that produce output DC currents in the range of $\pm 16$ mA to $\pm 20$ mA.	$\pm 20$ mA
DC Drive Bank B	Programs the drive strength of Bank B outputs. The user can select one out of two possible drive strength settings that produce output DC currents in the range of $\pm 16$ mA to $\pm 20$ mA.	$\pm 20$ mA
Output Enable for Bank B clocks	Enables/Disables CLKB[5:0] outputs. Each of the six outputs can be disabled <i>individually</i> if not used, to minimize electromagnetic interference (EMI) and switching noise.	Enable
Output Enable for Bank A clocks	Enables/Disables CLKA[5:0] outputs. Each of the six outputs can be disabled <i>individually</i> if not used, to minimize EMI and switching noise.	Enable
Inv CLKA0	Generates an inverted clock on the CLKA0 output. When this option is programmed, CLKA0 and CLKA1 will become complimentary pairs.	Non-invert
Inv CLKA2	Generates an inverted clock on the CLKA2 output. When this option is programmed, CLKA2 and CLKA3 will become complimentary pairs.	Non-invert
Inv CLKA4	Generates an inverted clock on the CLKA4 output. When this option is programmed, CLKA4 and CLKA5 will become complimentary pairs.	Non-invert
Inv CLKB0	Generates an inverted clock on the CLKB0 output. When this option is programmed, CLKB0 and CLKB1 will become complimentary pairs.	Non-invert
Inv CLKB2	Generates an inverted clock on the CLKB2 output. When this option is programmed, CLKB2 and CLKB3 will become complimentary pairs.	Non-invert

Table 1. (continued)

Configuration	Description	Default
Inv CLKB4	Generates an inverted clock on the CLKB4 output. When this option is programmed, CLKB4 and CLKB5 will become complimentary pairs.	Non-invert
Pull-down Enable	Enables/Disables internal pulldowns on all outputs	Enable
Fbk Pull-down Enable	Enables/Disables internal pulldowns on the feedback path (applicable to both internal and external feedback topologies)	Enable
Fbk Sel	Selects between the internal and the external feedback topologies	Internal

Below is a list of independent functions, which can be assigned to each of the four S1 and S2 combinations. When a particular S1 and S2 combination is selected, the device will assume the configuration (which is essentially a set of functions given in *Table 2*, below) that has been preassigned to that particular combination.

Table 2.

Function	Description	Default
Output Enable CLKB[5:4]	Enables/Disables CLKB[5:4] output pair	Enable
Output Enable CLKB[3:2]	Enables/Disables CLKB[3:2] output pair	Enable
Output Enable CLKB[1:0]	Enables/Disables CLKB[1:0] output pair	Enable
Output Enable CLKA[5:4]	Enables/Disables CLKA[5:4] output pair	Enable
Output Enable CLKA[3:2]	Enables/Disables CLKA[3:2] output pair	Enable
Output Enable CLKA[1:0]	Enables/Disables CLKA[1:0] output pair	Enable
Auto Power-down Enable	Enables/Disables the auto power down circuit, which monitors the reference clock rising edges and shuts down the device in case of a reference “failure.” This failure is triggered by a drift in reference frequency below a set limit. This auto power down circuit is disabled internally when one or more of the outputs are configured to be driven directly from the reference clock.	Enable
PLL Power-down	Shuts down the PLL when the device is configured as a non-PLL fanout buffer.	See <i>Table 4</i>
M[7:0]	Assigns an eight-bit value to reference divider –M. The divider can be any integer value from 1 to 256; however, the PLL input frequency cannot be lower than 10 MHz.	See <i>Table 4</i>
N[7:0]	Assigns an eight-bit value to feedback divider –N. The divider can be any integer value from 1 to 256; however, the PLL input frequency cannot be lower than 10 MHz.	See <i>Table 4</i>
X[6:0]	Assigns a seven-bit value to output divider –X. The divider can be any integer value from 5 to 130. Divide by 1,2,3, and 4 are preprogrammed on the device and can be activated by the appropriate output mux setting.	See <i>Table 4</i>
Divider Source	Selects between the PLL output and the reference clock as the source clock for the output dividers.	See <i>Table 4</i>
CLKA54 Source	Independently selects one out of the eight possible output dividers that will connect to the CLKA5 and CLKA4 pair. Please refer to <i>Table 3</i> for a list of divider values.	See <i>Table 4</i>
CLKA32 Source	Independently selects one out of the eight possible output dividers that will connect to the CLKA3 and CLKA2 pair. Please refer to <i>Table 3</i> for a list of divider values.	See <i>Table 4</i>
CLKA10 Source	Independently selects one out of the eight possible output dividers that will connect to the CLKA1 and CLKA0 pair. Please refer to <i>Table 3</i> for a list of divider values.	See <i>Table 4</i>
CLKB54 Source	Independently selects one out of the eight possible output dividers that will connect to the CLKB5 and CLKB4 pair. Please refer to <i>Table 3</i> for a list of divider values.	See <i>Table 4</i>
CLKB32 Source	Independently selects one out of the eight possible output dividers that will connect to the CLKB3 and CLKB2 pair. Please refer to <i>Table 3</i> for a list of divider values.	See <i>Table 4</i>
CLKB10 Source	Independently selects one out of the eight possible output dividers that will connect to the CLKB1 and CLKB0 pair. Please refer to <i>Table 3</i> for a list of divider values.	See <i>Table 4</i>

Table 3 is a list of output dividers that are independently selected to connect to each output pair.

In the default (pre-programmed) state of the device, S1 and S2 pins will function, as indicated in Table 4. One possible example output is shown in this table. This example is for illustration purposes only, since many other frequency combinations are possible for each pre-programmed configuration.

**Table 3.**

CLKA/B Source	Output Connects To
0 [000]	REF
1 [001]	Divide by 1
2 [010]	Divide by 2
3 [011]	Divide by 3
4 [100]	Divide by 4
5 [101]	Divide by X
6 [110]	Divide by 2X <sup>[1]</sup>
7 [111]	TEST mode [LOCK signal] <sup>[2]</sup>

**Table 4. Pre-Programmed Configuration**

Outputs	S2, S1	DivSrc	Example Output		
			REF Input (MHz)	VCO (MHz)	Output (MHz)
ClkA0, A1	00	1	25	200	200
ClkA2, A3	00	3	25	200	66.7
ClkA4, A5	00	X=6	25	200	33.3
ClkB0, B1	00	X=6	25	200	33.3
ClkB2, B3	00	4	25	200	50
ClkB4, B5	00	Ref	25	200	25
ClkA0, A1	01	4	100	200	50
ClkA2, A3	01	4	100	200	50
ClkA4, A5	01	4	100	200	50
ClkB0, B1	01	4	100	200	50
ClkB2, B3	01	X=8	100	200	25
ClkB4, B5	01	X=8	100	200	25
ClkA0, A1	10	X=8	33.3	266.6	33.3
ClkA2, A3	10	X=8	33.3	266.6	33.3
ClkA4, A5	10	X=8	33.3	266.6	33.3
ClkB0, B1	10	4	33.3	266.6	66.6
ClkB2, B3	10	4	33.3	266.6	66.6
ClkB4, B5	10	4	33.3	266.6	66.6
ClkA0, A1	11	Ref	100	powerdown	100
ClkA2, A3	11	Ref	100	powerdown	100
ClkA4, A5	11	Ref	100	powerdown	100
ClkB0, B1	11	2	100	powerdown	50
ClkB2, B3	11	2	100	powerdown	50
ClkB4, B5	11	2	100	powerdown	50

**Note:**

- Outputs will be rising edge aligned only to those outputs using this same device setting.
- When the source of an output pair is set to [111], the output pair becomes lock indicator signal. For example, if the source of an output pair (CLKA0, CLKA1) is set to [111], the CLKA0 and CLKA1, becomes lock indicator signals. In non-invert mode, CLKA0 and CLKA1 signals will be high when the PLL is in lock mode. If CLKA0 is in an invert mode, the CLKA0 will be low and the CLKA1 will be high when the PLL is in lock mode.

## Field Programming the CY23FP12-002

The CY23FP12-002 is programmed at the package level, i.e. in a programmer socket. The CY23FP12-002 is flash-technology based, so the parts can be reprogrammed up to 100 times. This allows for fast and easy design changes and product updates, and eliminates any issues with old and out-of-date inventory.

Samples and small prototype quantities can be programmed on the CY3672 programmer. Cypress's value-added distribution partners and third-party programming systems from BP Microsystems, HiLo Systems, and others are available for large production quantities.

### CyberClocks™ Software

CyberClocks is an easy-to-use software application that allows the user to custom-configure the CY23FP12-002. Users can specify the REF, PLL frequency, output frequencies and/or post-dividers, and different functional options. CyberClocks outputs an industry standard JEDEC file used for programming the CY23FP12-002.

CyberClocks can be downloaded free of charge from the Cypress website at [www.cypress.com](http://www.cypress.com).

### CY3672 FTG Development Kit

The Cypress CY3672 FTG Development Kit comes complete with everything needed to design with the CY23FP12-002 and program samples and small prototype quantities. The kit comes with the latest version of CyberClocks and a small portable programmer that connects to a PC serial port for on-the-fly programming of custom frequencies.

The JEDEC file output of CyberClocks can be downloaded to the portable programmer for small-volume programming, or for use with a production programming system for larger volumes.

## CY23FP12-002 Frequency Calculation

The CY23FP12-002 is an extremely flexible clock buffer with up to twelve individual outputs, generated from an integrated PLL.

There are four variables used to determine the final output frequency. These are the input Reference Frequency M, the N dividers, and the post divider X.

The basic PLL block diagram is shown in Figure 1. Each of the six clock outputs pair has many output options available to it. There are six post divider options: /1, /2, /3, /4, /X, and /2X. The post divider options can be applied to the calculated PLL frequency or to the REF directly. The feedback either is connected to CLKA0 internally or connected to any output externally.

A programmable divider, M, is inserted between the reference input, REF, and the phase detector. The divider M can be any integer 1 to 256. The PLL input frequency cannot be lower than 10 MHz or higher than 200 MHz.

A programmable divider, N, is inserted between the feedback input, FBK, and the phase detector. The divider N can be any integer 1 to 256. The PLL input frequency cannot be lower than 10 MHz or higher than 200 MHz.

So the output can be calculated as following:

$$F_{REF} / M = F_{FBK} / N.$$

$$F_{PLL} = (F_{REF} * N * \text{post divider}) / M.$$

$$F_{OUT} = F_{PLL} / \text{post divider}.$$

In addition to above divider options, the another option bypasses the PLL and passes the REF directly to the output.

$$F_{OUT} = F_{REF}$$

**Absolute Maximum Conditions**

Parameter	Description	Condition	Min.	Max.	Unit
V <sub>DD</sub>	Supply Voltage	Non-functional	-0.5	7	VDC
V <sub>IN</sub>	Input Voltage REF	Relative to V <sub>CC</sub>	-0.5	7	VDC

**Notes:**

5. All parameters are specified with loaded outputs.
6. When the device is configured as a non-PLL fanout buffer (PLL Power-down enabled), the reference frequency can be lower than 10MHz. With auto power-down disabled and PLL power-down enabled, the reference frequency can be as low as DC level.
7. When the device is configured as a non-PLL fanout buffer (PLL Power-down enabled), the output frequency can be lower than 10MHz. With auto power-down disabled and PLL power-down enabled, the output frequency can be as low as DC level.
8. Guaranteed by statistical correlation. Tested initially and after any design or process changes that may affect these parameters.
9. TTB is the window between the earliest and the latest output clocks with respect to the input reference clock across variations in output frequency, supply voltage, operating temperature, input clock edge rate, and process. The measurements are taken with the AC test load specified and include output-output skew, cycle-cycle jitter, and dynamic phase error. TTB will be equal to or smaller than the maximum specified value at a given frequency.

**Switching Characteristics for CY23FP12-002SC/I <sup>[5]</sup>**

Parameter	Description	Test Conditions	Min.	Typ.	Max.	Unit
$t_{tsk}$	Tracking Skew	Input reference clock @ < 50-KHz modulation with $\pm 3.75\%$ spread			200	ps
$t_{LOCK}$	PLL Lock Time <sup>[5]</sup>	Stable power supply, valid clock at REF			1.0	ms
$T_{LD}$	Inserted Loop Delay	Max loop delay for PLL Lock (stable frequency)			7	ns
		Max loop delay to meet Tracking Skew Spec			4	ns
