1 Overview

This chapter lists all main features of the product family HYB25DC512[80/16]0B[E/F] and the ordering information.

1.1 Features

- Double data rate architecture: two data transfers per clock cycle
- Bidirectional data strobe (DQS) is transmitted and received with data, to be used in capturing data at the receiver
- DQS is edge-aligned with data for reads and is center-aligned with data for writes
- Differential clock inputs (CK and $\overline{\text{CK}}$)
- Four internal banks for concurrent operation
- Data mask (DM) for write data
- DLL aligns DQ and DQS transitions with CK transitions
- Commands entered on each positive CK edge; data and data mask referenced to both edges of DQS
- Burst Lengths: 2, 4, or 8
- CAS Latency: 1.5 (DDR200 only), 2, 2.5, 3
- Auto Precharge option for each burst access
- Auto Refresh and Self Refresh Modes
- RAS-lockout supported $t_{\text{RAP}} = t_{\text{RCD}}$
- 7.8 μs Maximum Average Periodic Refresh Interval
- 2.5 V (SSTL_2 compatible) I/O
- $V_{\text{DDQ}} = 2.5 \text{ V} \pm 0.2 \text{ V}$ (DDR200, DDR266, DDR333); $V_{\text{DDQ}} = 2.6 \text{ V} \pm 0.1 \text{ V}$ (DDR400B)
- $V_{\text{DD}} = 2.5 \text{ V} \pm 0.2 \text{ V}$ (DDR200, DDR266, DDR333); $V_{\text{DD}} = 2.6 \text{ V} \pm 0.1 \text{ V}$ (DDR400B)
- Standard Temperature Range (0 °C - +70 °C)
- PG-TSOP11-66 and PG-TFBGA-60 packages
- RoHS¹⁾ compliant product types available (green product)

TABLE 1
Performance

Product Type Speed Code			-5	-6	Unit
Speed Grade	Component		DDR400B	DDR333	—
Max. Clock Frequency	@CL3	f_{CK3}	200	166	MHz
	@CL2.5	$f_{\text{CK2.5}}$	166	166	MHz
	@CL2	f_{CK2}	133	133	MHz

1) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

1.2 Description

The 512-Mbit Double-Data-Rate SDRAM is a high-speed CMOS, dynamic random-access memory containing 536,870,912 bits. It is internally configured as a quad-bank DRAM.

The 512-Mbit Double-Data-Rate SDRAM uses a double-data-rate architecture to achieve high-speed operation. The double data rate architecture is essentially a $2n$ prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the 512-Mbit Double-Data-Rate SDRAM effectively consists of a single $2n$ -bit wide, one clock cycle data transfer at the internal DRAM core and two corresponding n -bit wide, one-half-clock-cycle data transfers at the I/O pins.

A bidirectional data strobe (DQS) is transmitted externally, along with data, for use in data capture at the receiver. DQS is a strobe transmitted by the DDR SDRAM during Reads and by the memory controller during Writes. DQS is edge-aligned with data for Reads and center-aligned with data for Writes.

The 512-Mbit Double-Data-Rate SDRAM operates from a differential clock (CK and $\overline{\text{CK}}$; the crossing of CK going HIGH and $\overline{\text{CK}}$ going LOW is referred to as the positive edge of CK). Commands (address and control signals) are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Read and write accesses to the DDR SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an Active command, which is then followed by a Read or Write command. The address bits registered coincident with the Active command are used to select the bank and row to be accessed. The address bits registered coincident with the Read or Write command are used to select the bank and the starting column location for the burst access.

The DDR SDRAM provides for programmable Read or Write burst lengths of 2, 4 or 8 locations. An Auto Precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst access. As with standard SDRAMs, the pipelined, multibank architecture of DDR SDRAMs allows for concurrent operation, thereby providing high effective bandwidth by hiding row precharge and activation time.

An auto refresh mode is provided along with a power-saving power-down mode. All inputs are compatible with the Industry Standard for SSTL_2. All outputs are SSTL_2, Class II compatible.

Note: The functionality described and the timing specifications included in this data sheet are for the DLL Enabled mode of operation.

HYB25DC512160BF-6	×16					

1) HYB : designator for memory components;

25DC: DDR SDRAMs at $V_{DDQ} = 2.5\text{ V}$;

512: 512 Mbit density;

800/160: product variations ×8 and ×16;

B: die revision;

L: low power (available on request);

F/C/E/T: package type FBGA (lead & halogen free), FBGA (lead containing), TSOP (lead & halogen free), and TSOP (lead containing).

2) Please check with your Qimonda representative that leadtime and availability of your preferred device type and version meet your project requirements.

3) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

2 Configuration

This chapter contains the chip configuration.

2.1 Configuration of PG-TSOP11-66

The ball configuration of a DDR SDRAM is listed by function in **Table 3**. The abbreviations used in the Pin#/Buffer# column are explained in **Table 4** and **Table 5** respectively. The chip numbering for TSOP is depicted in **Figure 1**.

Notes

1. For a burst length of two, A1-Ai selects the two-data-element block; A0 selects the first access within the block.
2. For a burst length of four, A2-Ai selects the four-data-element block; A0-A1 selects the first access within the block.
3. For a burst length of eight, A3-Ai selects the eight-data-element block; A0-A2 selects the first access within the block.
4. Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.

Write (Select Bank And Column, And Start Write Burst)	L	H	L	L	Bank/Col	Write	1)4)
Burst Terminate	L	H	H	L	X	BST	1)5)
Precharge (Deactivate Row In Bank Or Banks)	L	L	H	L	Code	PRE	1)6)
Auto Refresh Or Self Refresh (Enter Self Refresh Mode)	L	L	L	H	X	AR/SR	1)7)8)
Mode Register Set	L	L	L	L	Op-Code	MRS	1)9)

1) CKE is HIGH for all commands shown except Self Refresh. I_{REF} must be maintained during Self Refresh operation.

2) Deselect and NOP are functionally interchangeable.

3) BA0-BA1 provide bank address and A0-A12 provide row address.

4) BA0, BA1 provide bank address; A0-A9 (x16 device); A0 - A9, A11 (x8 device) provide column address ; A10 HIGH enables the Auto Precharge feature (nonpersistent), A10 LOW disables the Auto Precharge feature.

5) Applies only to read bursts with Auto Precharge disabled; this command is undefined (and should not be used) for read bursts with Auto Precharge enabled or for write bursts.

6) A10 LOW: BA0, BA1 determine which bank is precharged. A10 HIGH: all banks are precharged and BA0, BA1 are "Don't Care".

7) This command is AUTO REFRESH if CKE is HIGH; Self Refresh if CKE is LOW.

HYB25DC512[80/16]0B[E/F]
Double-Data-Rate SDRAM

- 8) Internal refresh counter controls row and bank addressing; all inputs and I/Os are “Don’t Care” except for CKE.
- 9) BA0, BA1 select either the Base or the Extended Mode Register (BA0 = 0, BA1 = 0 selects Mode Register; BA0 = 1, BA1 = 0 selects Extended Mode Register; other combinations of BA0-BA1 are reserved; A0-A12 provide the op-code to be written to the selected Mode Register).

TABLE 13
Truth Table 1b: DM Operation

Name (Function)	DM	DQs	Note

Write Inhibit	H	X	1)

1) Used to mask write data; provided coincident with the corresponding data.

TABLE 14
Truth Table 2: Clock Enable (CKE)

Current State	CKE n-1	CKEn	Command n	Action n	Note
	Previous Cycle	Current Cycle			
Self Refresh	L	L	X	Maintain Self-Refresh	1)
Self Refresh	L	H	Deselect or NOP	Exit Self-Refresh	2)
Power Down	L	L	X	Maintain Power-Down	—
Power Down	L	H	Deselect or NOP	Exit Power-Down	—
All Banks Idle	H	L	Deselect or NOP	Precharge Power-Down Entry	—
All Banks Idle	H	L	AUTO REFRESH	Self Refresh Entry	—
Bank(s) Active	H	L	Deselect or NOP	Active Power-Down Entry	—
	H	H	See Table 15	—	—

1) V_{REF} must be maintained during Self Refresh operation

2) Deselect or NOP commands should be issued on any clock edges occurring during the Self Refresh Exit (t_{XSNR}) period. A minimum of 200 clock cycles are needed before applying a read command to allow the DLL to lock to the input clock.

1. CKEn is the logic state of CKE at clock edge n: CKE n-1 was the state of CKE at the previous clock edge.
2. Current state is the state of the DDR SDRAM immediately prior to clock edge n.
3. COMMAND n is the command registered at clock edge n, and ACTION n is a result of COMMAND n.
4. All states and sequences not shown are illegal or reserved.

**TABLE 15****Truth Table 3: Current State Bank n - Command to Bank n (same bank)**

- 1) This table applies when CKE n-1 was HIGH and CKE n is HIGH (see [Table 14](#) and after $t_{\text{XSNR}}/t_{\text{XSRD}}$ has been met (if the previous state was self refresh).
- 2) This table is bank-specific, except where noted, i.e., the current state is for a specific bank and the commands shown are those allowed to be issued to that bank when in that state. Exceptions are covered in the notes below.
- 3) Current state definitions: Idle: The bank has been precharged, and t_{RP} has been met. Row Active: A row in the bank has been activated, and t_{RCD} has been met. No data bursts/accesses and no register accesses are in progress. Read: A Read burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated. Write: A Write burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated.
- 4) The following states must not be interrupted by a command issued to the same bank.
Precharging: Starts with registration of a Precharge command and ends when t_{RP} is met. Once t_{RP} is met, the bank is in the idle state.
Row Activating: Starts with registration of an Active command and ends when t_{RCD} is met. Once t_{RCD} is met, the bank is in the “row active” state.
Read w/Auto Precharge Enabled: Starts with registration of a Read command with Auto Precharge enabled and ends when t_{RP} has been met. Once t_{RP} is met, the bank is in the idle state.
Write w/Auto Precharge Enabled: Starts with registration of a Write command with Auto Precharge enabled and ends when t_{RP} has been met. Once t_{RP} is met, the bank is in the idle state. Deselect or NOP commands, or allowable commands to the other bank should be issued on any clock edge occurring during these states. Allowable commands to the other bank are determined by its current state and according to [Table 16](#).
- 5) The following states must not be interrupted by any executable command; Deselect or NOP commands must be applied on each positive clock edge during these states.
Refreshing: Starts with registration of an Auto Refresh command and ends when t_{RFC} is met. Once t_{RFC} is met, the DDR SDRAM is in the “all banks idle” state.
Accessing Mode Register: Starts with registration of a Mode Register Set command and ends when t_{MRD} has been met. Once t_{MRD} is met, the DDR SDRAM is in the “all banks idle” state.
Precharging All: Starts with registration of a Precharge All command and ends when t_{RP} is met. Once t_{RP} is met, all banks is in the idle state.
- 6) All states and sequences not shown are illegal or reserved.
- 7) Not bank-specific; requires that all banks are idle.
- 8) Reads or Writes listed in the Command/Action column include Reads or Writes with Auto Precharge enabled and Reads or Writes with Auto Precharge disabled.
- 9) May or may not be bank-specific; if all/any banks are to be precharged, all/any must be in a valid state for precharging.
- 10) Not bank-specific; BURST TERMINATE affects the most recent Read burst, regardless of bank.
- 11) Requires appropriate DM masking.

TABLE 16
Truth Table 4: Current State Bank n - Command to Bank m (different bank)

Current State	$\overline{CS}$	$\overline{RAS}$	$\overline{CAS}$	$\overline{WE}$	Command	Action	Note

	L	H	L	H	Read	Select column and start Read burst	1) to 7), 9)
	L	H	L	L	Write	Select column and start new Write burst	1) to 7), 9)
	L	L	H	L	Precharge	—	1) to 6)

- 1) This table applies when CKE n-1 was HIGH and CKE n is HIGH (see **Table 14: Clock Enable (CKE)** and after t_{XSNR}/t_{XSRD} has been met (if the previous state was self refresh).
- 2) This table describes alternate bank operation, except where noted, i.e., the current state is for bank n and the commands shown are those allowed to be issued to bank m (assuming that bank m is in such a state that the given command is allowable). Exceptions are covered in the notes below.
- 3) Current state definitions:
 Idle: The bank has been precharged, and t_{RP} has been met.
 Row Active: A row in the bank has been activated, and t_{RCD} has been met. No data bursts/accesses and no register accesses are in progress.
 Read: A Read burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated.
 Write: A Write burst has been initiated, with Auto Precharge disabled, and has not yet terminated or been terminated.
 Read with Auto Precharge Enabled: See ¹⁰⁾.
 Write with Auto Precharge Enabled: See ¹⁰⁾.
- 4) AUTO REFRESH and Mode Register Set commands may only be issued when all banks are idle.
- 5) A BURST TERMINATE command cannot be issued to another bank; it applies to the bank represented by the current state only.
- 6) All states and sequences not shown are illegal or reserved.
- 7) Reads or Writes listed in the Command/Action column include Reads or Writes with Auto Precharge enabled and Reads or Writes with Auto Precharge disabled.
- 8) Requires appropriate DM masking.

HYB25DC512[80/16]0B[E/F]
Double-Data-Rate SDRAM

- 9) Concurrent Auto Precharge: This device supports “Concurrent Auto Precharge”. When a read with auto precharge or a write with auto precharge is enabled any command may follow to the other banks as long as that command does not interrupt the read or write data transfer and all other limitations apply (e.g. contention between READ data and WRITE data must be avoided). The minimum delay from a read or write command with auto precharge enable, to a command to a different banks is summarized in **Table 17**.
- 10) A Write command may be applied after the completion of data output.

TABLE 17**Truth Table 5: Concurrent Auto Precharge**

From Command	To Command (different bank)	Minimum Delay with Concurrent Auto Precharge Support	Unit
WRITE w/AP	Read or Read w/AP	$1 + (BL/2) + t_{WTR}$	t_{CK}
	Write to Write w/AP	$BL/2$	t_{CK}
	Precharge or Activate	1	t_{CK}
Read w/AP	Read or Read w/AP	$BL/2$	t_{CK}
	Write or Write w/AP	$CL \text{ (rounded up)} + BL/2$	t_{CK}
	Precharge or Activate	1	t_{CK}

4 Electrical Characteristics

This chapter describes the electrical characteristics.

4.1 Operating Conditions

This chapter contains the operating conditions tables.

TABLE 18
Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note/ Test Condition
		Min.	Typ.	Max.		
Voltage on I/O pins relative to V_{SS}	V_{IN}, V_{OUT}	-0.5	—	$V_{DDQ} + 0.5$	V	—
Voltage on inputs relative to V_{SS}	V_{IN}	-1	—	+3.6	V	—
Voltage on V_{DD} supply relative to V_{SS}	V_{DD}	-1	—	+3.6	V	—
Voltage on V_{DDQ} supply relative to V_{SS}	V_{DDQ}	-1	—	+3.6	V	—
Operating temperature (ambient)	T_A	0	—	+70	°C	—
Storage temperature (plastic)	T_{STG}	-55	—	+150	°C	—
Power dissipation (per SDRAM component)	P_D	—	1	—	W	—
Short circuit output current	I_{OUT}	—	50	—	mA	—

Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

TABLE 19
Input and Output Capacitances

Parameter	Symbol	Values			Unit	Note/ Test Condition
		Min.	Typ.	Max.		
Input Capacitance: CK, $\overline{\text{CK}}$	C_{I1}	2.0	—	3.0	pF	TSOP ¹⁾
		1.5	—	2.5	pF	FBGA ¹⁾
Delta Input Capacitance	C_{dl1}	—	—	0.25	pF	¹⁾
Input Capacitance: All other input-only pins	C_{I2}	2.0	—	3.0	pF	TSOP ¹⁾
		1.5	—	2.5	pF	FBGA ¹⁾
Delta Input Capacitance: All other input-only pins	C_{dlO}	—	—	0.5	pF	¹⁾
Input/Output Capacitance: DQ, DQS, DM	C_{IO}	4.0	—	5.0	pF	TSOP ¹⁾²⁾
		3.5	—	4.5	pF	FBGA ¹⁾²⁾
Delta Input/Output Capacitance: DQ, DQS, DM	C_{dlO}	—	—	0.5	pF	¹⁾

1) These values are guaranteed by design and are tested on a sample base only. $V_{DDQ} = V_{DD} = 2.5 \text{ V} \pm 0.2 \text{ V}$, $f = 100 \text{ MHz}$, $T_A = 25^\circ\text{C}$, $V_{OUT(DC)} = V_{DDQ}/2$, V_{OUT} (Peak to Peak) 0.2 V. Unused pins are tied to ground.

2) DM inputs are grouped with I/O pins reflecting the fact that they are matched in loading to DQ and DQS to facilitate trace matching at the board level.

HYB25DC512[80/16]0B[E/F]
Double-Data-Rate SDRAM**TABLE 20**
Electrical Characteristics and DC Operating Conditions

Parameter	Symbol	Values			Unit	Note/ Test Condition ¹⁾
		Min.	Typ.	Max.		
Device Supply Voltage	V_{DD}	2.3	2.5	2.7	V	$f_{CK} \leq 166$ MHz
Device Supply Voltage	V_{DD}	2.5	2.6	2.7	V	$f_{CK} > 166$ MHz ²⁾
Output Supply Voltage	V_{DDQ}	2.3	2.5	2.7	V	$f_{CK} \leq 166$ MHz ³⁾
Output Supply Voltage	V_{DDQ}	2.5	2.6	2.7	V	$f_{CK} > 166$ MHz ²⁾³⁾
Supply Voltage, I/O Supply Voltage	V_{SS}, V_{SSQ}	0	—	0	V	—
Input Reference Voltage	V_{REF}	$0.49 \times V_{DDQ}$	$0.5 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	⁴⁾
I/O Termination Voltage (System)	V_{TT}	$V_{REF} - 0.04$	—	$V_{REF} + 0.04$	V	⁵⁾
Input High (Logic1) Voltage	$V_{IH(DC)}$	$V_{REF} + 0.15$	—	$V_{DDQ} + 0.3$	V	⁶⁾
Input Low (Logic0) Voltage	$V_{IL(DC)}$	-0.3	—	$V_{REF} - 0.15$	V	⁶⁾
Input Voltage Level, CK and $\overline{CK}$ Inputs	$V_{IN(DC)}$	-0.3	—	$V_{DDQ} + 0.3$	V	⁶⁾
Input Differential Voltage, CK and $\overline{CK}$ Inputs	$V_{ID(DC)}$	0.36	—	$V_{DDQ} + 0.6$	V	⁶⁾⁷⁾
VI-Matching Pull-up Current to Pull-down Current	I_{Ratio}	0.71	—	1.4	—	⁸⁾
Input Leakage Current	I_I	-2	—	2	μA	Any input $0 V \leq V_{IN} \leq V_{DD}$; All other pins not under test = 0 V ⁹⁾
Output Leakage Current	I_{OZ}	-5	—	5	μA	DQs are disabled; $0 V \leq V_{OUT} \leq V_{DDQ}$ ⁹⁾
Output High Current, Normal Strength Driver	I_{OH}	—	—	-16.2	mA	$V_{OUT} = 1.95 V$
Output Low Current, Normal Strength Driver	I_{OL}	16.2	—	—	mA	$V_{OUT} = 0.35 V$

1) $0^\circ C \leq T_A \leq 70^\circ C$; $V_{DDQ} = 2.5 V \pm 0.2 V$, $V_{DD} = +2.5 V \pm 0.2 V$;

2) DDR400 conditions apply for all clock frequencies above 166 MHz

3) Under all conditions, V_{DDQ} must be less than or equal to V_{DD} .4) Peak to peak AC noise on V_{REF} may not exceed $\pm 2\% V_{REF,DC}$. V_{REF} is also expected to track noise variations in V_{DDQ} .5) V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} , and must track variations in the DC level of V_{REF} .6) Inputs are not recognized as valid until V_{REF} stabilizes.7) V_{ID} is the magnitude of the difference between the input level on CK and the input level on $\overline{CK}$.

8) The ratio of the pull-up current to the pull-down current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltage from 0.25 to 1.0 V. For a given output, it represents the maximum difference between pull-up and pull-down drivers due to process variation.

9) Values are shown per pin.

4.2 AC Characteristics

Notes 1-5 apply to the following Tables; Electrical Characteristics and DC Operating Conditions, AC Operating Conditions, I_{DD} Specifications and Conditions, and Electrical Characteristics and AC Timing.

Notes

1. All voltages referenced to V_{SS} .
2. Tests for AC timing, I_{DD} , and electrical, AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. **Figure 4** represents the timing reference load used in defining the relevant timing parameters of the part. It is not intended to be either a precise representation of the typical system environment nor a depiction of the actual load presented by a production tester. System designers will use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers will correlate to their production test conditions (generally a coaxial transmission line terminated at the tester electronics).
4. AC timing and I_{DD} tests may use a V_{IL} to V_{IH} swing of up to 1.5 V in the test environment, but input timing is still referenced to V_{REF} (or to the crossing point for CK, $\overline{CK}$), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1 V/ns in the range between $V_{IL(AC)}$ and $V_{IH(AC)}$.
5. The AC and DC input level specifications are as defined in the SSTL_2 Standard (i.e. the receiver effectively switches as a result of the signal crossing the AC input level, and remains in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level).
6. For System Characteristics like Setup & Holdtime Derating for Slew Rate, I/O Delta Rise/Fall Derating, DDR SDRAM Slew Rate Standards, Overshoot & Undershoot specification and Clamp V - I characteristics see the latest Industry specification for DDR components.

Double-Data-Rate SDRAM

TABLE 21
AC Operating Conditions

Parameter	Symbol	Values		Unit	Note/ Test Condition
		Min.	Max.		
Input High (Logic 1) Voltage, DQ, DQS and DM Signals	$V_{IH(AC)}$	$V_{REF} + 0.31$	—	V	1)2)3)
Input Low (Logic 0) Voltage, DQ, DQS and DM Signals	$V_{IL(AC)}$	—	$V_{REF} - 0.31$	V	1)2)3)
Input Differential Voltage, CK and $\overline{CK}$ Inputs	$V_{ID(AC)}$	0.7	$V_{DDQ} + 0.6$	V	1)2)3)4)
Input Closing Point Voltage, CK and $\overline{CK}$ Inputs	$V_{IX(AC)}$	$0.5 \times V_{DDQ} - 0.2$	$0.5 \times V_{DDQ} + 0.2$	V	1)2)3)5)

1) $V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$, $V_{DD} = +2.5\text{ V} \pm 0.2\text{ V}$ (DDR200 - DDR333); $V_{DDQ} = 2.6\text{ V} \pm 0.1\text{ V}$, $V_{DD} = +2.6\text{ V} \pm 0.1\text{ V}$ (DDR400); $0^\circ\text{C} \leq T_A \leq 70^\circ\text{C}$

2) Input slew rate = 1 V/ns.

3) Inputs are not recognized as valid until V_{REF} stabilizes.

4) V_{ID} is the magnitude of the difference between the input level on CK and the input level on $\overline{CK}$.

5) The value of V_{IX} is expected to equal $0.5 \times V_{DDQ}$ of the transmitting device and must track variations in the DC level of the same.

TABLE 22
AC Timing - Absolute Specifications

Exit self-refresh to read command	t_{XSRD}	200	—	200	—	t_{CK}	2)3)4)5)

1) $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$; $V_{DDQ} = 2.5\text{ V} \pm 0.2\text{ V}$, $V_{DD} = +2.5\text{ V} \pm 0.2\text{ V}$ (DDR333); $V_{DDQ} = 2.6\text{ V} \pm 0.1\text{ V}$, $V_{DD} = +2.6\text{ V} \pm 0.1\text{ V}$ (DDR400)

2) Input slew rate $\geq 1\text{ V/ns}$ for DDR400, DDR333

3) The CK/ $\overline{\text{CK}}$ input reference level (for timing reference to CK/ $\overline{\text{CK}}$) is the point at which CK and $\overline{\text{CK}}$ cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$, is V_{REF} . CK/ $\overline{\text{CK}}$ slew rate are $\geq 1.0\text{ V/ns}$.

4) Inputs are not recognized as valid until V_{REF} stabilizes.

5) The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (note 3) is V_{TT} .

6) For each of the terms, if not already an integer, round to the next highest integer. t_{CK} is equal to the actual system clock cycle time.

7) t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).

8) Fast slew rate $\geq 1.0\text{ V/ns}$, slow slew rate $\geq 0.5\text{ V/ns}$ and $< 1\text{ V/ns}$ for command/address and CK & $\overline{\text{CK}}$ slew rate $> 1.0\text{ V/ns}$, measured between $V_{IH(ac)}$ and $V_{IL(ac)}$.

9) These parameters guarantee device timing, but they are not necessarily tested on each device.

10) The specific requirement is that DQS be valid (HIGH, LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW at this time, depending on t_{DQSS} .

11) The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.

TABLE 23
 I_{DD} Conditions

Parameter	Symbol
Operating Current: one bank; active/ precharge; $t_{RC} = t_{RCMIN}$; $t_{CK} = t_{CKMIN}$; DQ, DM, and DQS inputs changing once per clock cycle; address and control inputs changing once every two clock cycles.	I_{DD0}
Operating Current: one bank; active/read/precharge; Burst = 4; Refer to the following page for detailed test conditions.	I_{DD1}
Precharge Power-Down Standby Current: all banks idle; power-down mode; $CKE \leq V_{ILMAX}$; $t_{CK} = t_{CKMIN}$	I_{DD2P}
Precharge Floating Standby Current: $\overline{CS} \geq V_{IHMIN}$, all banks idle; $CKE \geq V_{IHMIN}$; $t_{CK} = t_{CKMIN}$, address and other control inputs changing once per clock cycle, $V_{IN} = V_{REF}$ for DQ, DQS and DM.	I_{DD2F}
Precharge Quiet Standby Current: $\overline{CS} \geq V_{IHMIN}$, all banks idle; $CKE \geq V_{IHMIN}$; $t_{CK} = t_{CKMIN}$, address and other control inputs stable at $\geq V_{IHMIN}$ or $\leq V_{ILMAX}$; $V_{IN} = V_{REF}$ for DQ, DQS and DM.	I_{DD2Q}
Active Power-Down Standby Current: one bank active; power-down mode; $CKE \leq V_{ILMAX}$; $t_{CK} = t_{CKMIN}$; $V_{IN} = V_{REF}$ for DQ, DQS and DM.	I_{DD3P}
Active Standby Current: one bank active; $\overline{CS} \geq V_{IHMIN}$; $CKE \geq V_{IHMIN}$; $t_{RC} = t_{RASMAX}$; $t_{CK} = t_{CKMIN}$; DQ, DM and DQS inputs changing twice per clock cycle; address and control inputs changing once per clock cycle	I_{DD3N}
Operating Current: one bank active; Burst = 2; reads; continuous burst; address and control inputs changing once per clock cycle; 50 % of data outputs changing on every clock edge; CL = 2 for DDR200 and DDR266A, CL = 3 for DDR333; $t_{CK} = t_{CKMIN}$; $I_{OUT} = 0$ mA	I_{DD4R}
Operating Current: one bank active; Burst = 2; writes; continuous burst; address and control inputs changing once per clock cycle; 50 % of data outputs changing on every clock edge; CL = 2 for DDR200 and DDR266A, CL = 3 for DDR333; $t_{CK} = t_{CKMIN}$	I_{DD4W}
Auto-Refresh Current: $t_{RC} = t_{RFCMIN}$, burst refresh	I_{DD5}
Self-Refresh Current: $CKE \leq 0.2$ V; external clock on; $t_{CK} = t_{CKMIN}$	I_{DD6}
Operating Current: four bank; four bank interleaving with BL = 4; Refer to the following page for detailed test conditions.	I_{DD7}

HYB25DC512[80/16]0B[E/F]
Double-Data-Rate SDRAM

TABLE 24
 I_{DD} Specification

Symbol	-5	-6	Unit	Note ¹⁾
	DDR400B	DDR333		
I_{DD0}	80	75	mA	$\times 8^{2)3)}$
	100	90	mA	$\times 16^{3)}$
I_{DD1}	90	85	mA	$\times 8^{3)}$
	115	105	mA	$\times 16^{3)}$
I_{DD2P}	1.7	1.6	mA	³⁾
I_{DD2F}	30	25	mA	³⁾
I_{DD2Q}	19	17	mA	³⁾
I_{DD3P}	12	11	mA	³⁾
I_{DD3N}	39	35	mA	$\times 8^{3)}$
	42	37	mA	$\times 16^{3)}$
I_{DD4R}	85	77	mA	$\times 8^{3)}$
	120	105	mA	$\times 16^{3)}$
I_{DD4W}	90	81	mA	$\times 8^{3)}$
	125	110	mA	$\times 16^{3)}$
I_{DD5}	205	185	mA	³⁾
I_{DD6}	2.8	2.7	mA	⁴⁾
	2.5	2.5	mA	Low power
I_{DD7}	260	234	mA	$\times 8^{3)}$
	285	255	mA	$\times 16^{3)}$

1) Test conditions : $V_{DD} = 2.7\text{ V}$, $T_A = 10\text{ }^{\circ}\text{C}$

2) I_{DD} specifications are tested after the device is properly initialized and measured at 200 MHz.

3) Input slew rate = 1 V/ns.

4) Enables on-chip refresh and address counters.

5 Package Dimensions

The chapter describes the package types used for this product family.

FIGURE 5
Package Outline PG-TSOPII-66

- 1) Does not include plastic or metal protrusion of 0.15 max. per side
- 2) Does not include plastic protrusion of 0.25 max. per side
- 3) Does not include dambar protrusion of 0.13 max.

Notes

1. Drawing according to ISO 8015
2. Dimensions in mm
3. General tolerances ± 0.15
