
Low Quiescent Current 30mA Regulator

● General Description

The CDT71XX series is a three-terminal positive voltage regulator that is made by CMOS process. The CDT71XX series has higher precision output voltage and consumes less current than existing three-terminal voltage regulator. Battery power equipment can have a higher performance and a longer service life.

● Application Circuit

To avoid the surge voltages of V_{IN} , keep $C1$ with the capacitance of 10uF. To reduce output ripple and improve response time of load, keep $C2$ with the capacitance of 10uF. It's possible without each capacitance if V_{IN} side is closed to GND and output ripple is limited.
