Dual Video Amplifiers

CMOS

Each of these devices contains two amplifiers realized in CMOS. Each amp also employs two lateral NPN bipolar transistors.

The MC14576A contains two internally-compensated operational amplifiers. On-chip gain-setting resistors result in a noninverting voltage gain of 6.0 dB $\pm$ 1.0 dB at 4.43 MHz for each amp. Each noninverting input of the MC14576A appears as a mostly-capacitive load of about 10 pF.

The MC14577A also contains two internally-compensated operational amplifiers. However, the gain for each amp is adjustable with external components. (The value of the closed-loop voltage gain with a 150 Ω load should not exceed 10 dB at 5 MHz and 6 dB at 10 MHz.) All inputs of the MC14577A appear as mostly-capacitive loads of about 10 pF.

MAXIMUM RATINGS*

Symbol	Parameter	Value	Unit
V _{DD}	DC Supply Voltage (Referenced to V _{SS})	-0.5 to +14	V
V _{in}	DC Input Voltage	V _{SS} -0.5 to V _{DD} +0.5	V
V _{out}	DC Output Voltage	V _{SS} -0.5 to V _{DD} +0.5	V
T _{stg}	Storage Temperature	-65 to +150	°C
T _L	Lead Temperature (10-Second Soldering)	260	°C

* Maximum Ratings are those values beyond which damage to the device may occur.

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range V_{SS} ≤ (V_{in} or V_{out}) ≤ V_{DD}. Unused inputs must always be tied to an appropriate voltage level (e.g., either V_{SS} or V_{DD}). Unused outputs must be left open.
