

## **JW050C, JW075C, JW100C, JW150C Power Modules: dc-dc Converters; 36 to 75 Vdc Input, 15 Vdc Output; 50 W to 150 W**

The JW050C, JW075C, JW100C, and JW150C Power Modules use advanced, surface-mount technology and deliver high-quality, efficient, and compact dc-dc conversion.

### **Applications**

- Distributed power architectures
- Workstations
- EDP equipment
- Telecommunications
- Wireless

### **Options**

- Choice of remote on/off logic configuration
- Heat sink available for extended operation

### **Description**

The JW050C, JW075C, JW100C, and JW150C Power Modules are dc-dc converters that operate over an input voltage range of 36 Vdc to 75 Vdc and provide a precisely regulated dc output. The outputs are fully isolated from the inputs, allowing versatile polarity configurations and grounding connections. The modules have maximum power ratings from 50 W to 150 W at a typical full-load efficiency of 88%.

The sealed modules offer a metal baseplate for excellent thermal performance. Threaded-through holes are provided to allow easy mounting or addition of a heat sink for high-temperature applications. The standard feature set includes remote sensing, output trim, and remote on/off for convenient flexibility in distributed power applications.

### **Features**

- Small size: 61.0 mm x 57.9 mm x 12.7 mm (2.40 in. x 2.28 in. x 0.50 in.)
- High power density
- High efficiency: 88% typical
- Low output noise
- Constant frequency
- Industry-standard pinout
- Metal baseplate
- 2:1 input voltage range
- Overtemperature protection (100 W and 150 W only)
- Remote sense
- Remote on/off
- Adjustable output voltage
- Case ground pin
- UL\* Recognized, CSA† Certified, VDE Licensed
- CE mark meets 73/23/EEC and 93/68/EEC directives‡

\* UL is a registered trademark of Underwriters Laboratories, Inc.

† CSA is a registered trademark of Canadian Standards Assn.

‡ This product is intended for integration into end-use equipment. All the required procedures for CE marking of end-use equipment should be followed. (The CE mark is placed on selected products.)

## Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

| Parameter                                                           | Symbol         | Min | Max  | Unit |
|---------------------------------------------------------------------|----------------|-----|------|------|

## Fusing Considerations

**CAUTION: This power module is not internally fused. An input line fuse must always be used.**

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow, dc fuse with a maximum rating of 20 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

## Electrical Specifications (continued)

Table 2. Output Specifications

| Parameter                                                                                                                                                                | Device | Symbol              | Min   | Typ  | Max    | Unit                  |

### Figure 17. Input Reflected-Ripple Test Setup

**Note:** Measure input reflected-ripple current with a simulated source inductance ( $L_{TEST}$ ) of 12  $\mu\text{H}$ . Capacitor  $C_S$  offsets possible battery impedance. Measure current as shown above.

**Note:** Use a 1.0  $\mu\text{F}$  ceramic capacitor and a 10  $\mu\text{F}$  aluminum or tantalum capacitor. Scope measurement should be made using a BNC socket. Position the load between 51 mm and 76 mm (2 in. and 3 in.) from the module.

**Note:** All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \left( \frac{[V_o(+)-V_o(-)]I_o}{[V_I(+)-V_I(-)]I_I} \right) \times 100$$

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. For the test configuration in Figure 17, a 33  $\mu$ F electrolytic capacitor (ESR < 0.7  $\Omega$  at 100 kHz) mounted close to the power module helps ensure stability of the unit. For other highly inductive source impedances, consult the factory for further application guidelines.

## Design Considerations (continued)

### Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., UL-1950, CSA 22.2-950, and EN60950.

For the converter output to be considered meeting the requirements of safety extra-low voltage (SELV), one of the following must be true:

- All inputs are SELV and floating, with the output also floating.
- All inputs are SELV and grounded, with the output also grounded.
- Any non-SELV input must be provided with reinforced insulation from any other hazardous voltages, including the ac mains, and must have a SELV reliability test performed on it in combination with the converters. Inputs must meet SELV requirements.

If the input meets extra-low voltage (ELV) requirements, then the converter's output is considered ELV.

The input to these units is to be provided with a maximum 20 A normal-blow fuse in the ungrounded lead.

## Electrical Descriptions

### Current Limit

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output current decrease or increase). The unit operates normally once the output current is brought back into its specified range.

## Feature Descriptions

### Remote On/Off

Two remote on/off options are available. Positive logic remote on/off turns the module on during a logic high voltage on the ON/OFF pin, and off during a logic low. Negative logic remote on/off turns the module off during a logic high and on during a logic low. Negative logic (code suffix "1") is the factory-preferred configuration.

To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the  $V_{I(-)}$  terminal ( $V_{on/off}$ ). The switch can be an open collector or equivalent (see Figure 20). A logic low is  $V_{on/off} = 0$  V to 1.2 V. The maximum  $I_{on/off}$  during a logic low is 1 mA. The switch should maintain a logic-low voltage while sinking 1 mA.

During a logic high, the maximum  $V_{on/off}$  generated by the power module is 15 V. The maximum allowable leakage current of the switch at  $V_{on/off} = 15$  V is 50  $\mu$ A.

If not using the remote on/off feature, do one of the following:

- For negative logic, short ON/OFF pin to  $V_{I(-)}$ .
- For positive logic, leave ON/OFF pin open.

8-720 (C).c

Figure 20. Remote On/Off Implementation

## Feature Descriptions (continued)

### Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections. The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range given in the Feature Specifications table, i.e.:

$$[V_o(+)-V_o(-)]-[SENSE(+)-SENSE(-)] \leq 0.5 \text{ V}$$

The voltage between the  $V_o(+)$  and  $V_o(-)$  terminals must not exceed 15.5 V. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 21.

If not using the remote-sense feature to regulate the output at the point of load, then connect  $SENSE(+)$  to  $V_o(+)$  and  $SENSE(-)$  to  $V_o(-)$  at the module.

Figure 21. Effective Circuit Configuration for Single-Module Remote-Sense Operation

### Output Voltage Set-Point Adjustment (Trim)

Output voltage trim allows the user to increase or decrease the output voltage set point of a module. This is accomplished by connecting an external resistor between the TRIM pin and either the  $SENSE(+)$  or  $SENSE(-)$  pins. With an external resistor between the TRIM and  $SENSE(-)$  pins ( $R_{adj-down}$ ), the output voltage set point ( $V_{o, adj}$ ) decreases (see Figure 22). The following equation determines the required external-resistor value to obtain a percentage output voltage change of  $\Delta\%$ .

$$R_{adj-down} = \left( \frac{100}{\Delta\%} - 2 \right) \text{ k}\Omega$$

The test results for this configuration are displayed in Figure 25. This figure applies to all output voltages.

With an external resistor connected between the TRIM and  $SENSE(+)$  pins ( $R_{adj-up}$ ), the output voltage set point ( $V_{o, adj}$ ) increases (see Figure 24).

**Note:** The output voltage of this module may be increased to a maximum of 0.5 V. The 0.5 V is the combination of both the remote-sense and the output voltage set-point adjustment (trim). Do not exceed 15.5 V between the  $V_o(+)$  and  $V_o(-)$  terminals.

The following equation determines the required external-resistor value to obtain a percentage output voltage change of  $\Delta\%$ .

$$R_{adj-up} = \left( \frac{V_o(100 + \Delta\%)}{1.225\Delta\%} - \frac{(100 + 2\Delta\%)}{\Delta\%} \right) \text{ k}\Omega$$

**Only trim up to 0.5 V maximum. See note above.**

The test results for this configuration are displayed in Figure 25. For applications requiring voltage between 15 V and 24 V, consider using the JW050H, JW075H, JW100H, or JW150H (24 V) trimmed down.

The voltage between the  $V_o(+)$  and  $V_o(-)$  terminals must not exceed 16.5 V. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 21.

If not using the trim feature, leave the TRIM pin open.

8-879 (C)

Figure 24. Circuit Configuration to Increase Output Voltage

8-715 (C).b

8-2092 (C)

Figure 25. Resistor Selection for Increased Output Voltage

### Output Overvoltage Clamp

The output overvoltage clamp consists of control circuitry, independent of the primary regulation loop, that monitors the voltage on the output terminals. The control loop of the clamp has a higher voltage set point than the primary loop (see Feature Specifications table). This provides a redundant voltage control that reduces the risk of output overvoltage.

### Overtemperature Protection (Shutdown)

The 100 W and 150 W modules feature an overtemperature protection circuit to safeguard against thermal damage.

The circuit shuts down the module when the maximum case temperature is exceeded. The module restarts automatically after cooling.

## Thermal Considerations

### Introduction

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the unit are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature. Peak temperature ( $T_c$ ) occurs at the position indicated in Figure 26.

8-716 (C).f

Note: Top view, pin locations are for reference.  
Measurements shown in millimeters and (inches).

**Figure 26. Case Temperature Measurement Location**

The temperature at this location should not exceed 100 °C. The output power of the module should not exceed the rated power for the module as listed in the Ordering Information table.

Although the maximum case temperature of the power modules is 100 °C, you can limit this temperature to a lower value for extremely high reliability.

For additional information on these modules, refer to the Lucent Technologies *Thermal Management JC-, JFC-, JW-, and JFW-Series 50 W to 150 W Board-Mounted Power Modules Technical Note* (TN97-008EPS).

### Heat Transfer Without Heat Sinks

Increasing airflow over the module enhances the heat transfer via convection. Figure 27 shows the maximum power that can be dissipated by the module without exceeding the maximum case temperature versus local ambient temperature ( $T_A$ ) for natural convection through 4 m/s (800 ft./min.).

Note that the natural convection condition was measured at 0.05 m/s to 0.1 m/s (10 ft./min. to 20 ft./min.); however, systems in which these power modules may be used typically generate natural convection airflow rates of 0.3 m/s (60 ft./min.) due to other heat dissipating components in the system. The use of Figure 27 is shown in the following example.

### Example

What is the minimum airflow necessary for a JW100C operating at nominal line, an output current of 6 A, and a maximum ambient temperature of 40 °C?

### Solution

Given:  $V_i = 54$  V  
 $I_o = 6$  A  
 $T_A = 40$  °C

Determine  $P_D$  (Use Figure 30.):

$P_D = 12.8$  W

Determine airflow ( $v$ ) (Use Figure 27.):

$v = 1.3$  m/s (260 ft./min.)

## Thermal Considerations (continued)

### Heat Transfer with Heat Sinks

The power modules have through-threaded, M3 x 0.5 mounting holes, which enable heat sinks or cold plates to attach to the module. The mounting torque must not exceed 0.56 N-m (5 in.-lb.). For a screw attachment from the pin side, the recommended hole size on the customer's PWB around the mounting hole is  $0.130 \pm 0.005$  inches. If a larger hole is used, the mounting torque from the pin side must not exceed 0.25 N-m (2.2 in.-lbs.).

Thermal derating with heat sinks is expressed by using the overall thermal resistance of the module. Total module thermal resistance ( $\theta_{ca}$ ) is defined as the maximum case temperature rise ( $\Delta T_{c, max}$ ) divided by the module power dissipation ( $P_D$ ):

$$\theta_{ca} = \left[ \frac{\Delta T_{c, max}}{P_D} \right] = \left[ \frac{(T_C - T_A)}{P_D} \right]$$

The location to measure case temperature ( $T_C$ ) is shown in Figure 26. Case-to-ambient thermal resistance vs. airflow is shown, for various heat sink configurations and heights, in Figure 32. These curves were obtained by experimental testing of heat sinks, which are offered in the product catalog.

8-1153 (C)

**Figure 32. Case-to-Ambient Thermal Resistance Curves; Either Orientation**

These measured resistances are from heat transfer from the sides and bottom of the module as well as the top side with the attached heat sink; therefore, the case-to-ambient thermal resistances shown are generally lower than the resistance of the heat sink by itself. The module used to collect the data in Figure 32 had a thermal-conductive dry pad between the case and the heat sink to minimize contact resistance. The use of Figure 32 is shown in the following example.

### Example

If an 85 °C case temperature is desired, what is the minimum airflow necessary? Assume the JW100C module is operating at nominal line and an output current of 6 A, maximum ambient air temperature of 40 °C, and the heat sink is 0.5 in.

### Solution

Given:  $V_i = 54$  V  
 $I_o = 6$  A  
 $T_A = 40$  °C  
 $T_C = 85$  °C  
 Heat sink = 0.5 in.

Determine  $P_D$  by using Figure 30:

$$P_D = 12.8$$

Then solve the following equation:

$$\theta_{ca} = \left[ \frac{(T_C - T_A)}{P_D} \right]$$

$$\theta_{ca} = \left[ \frac{(85 - 40)}{12.8} \right]$$

$$\theta_{ca} = 3.5 \text{ °C/W}$$

Use Figure 32 to determine air velocity for the 0.5 inch heat sink.

The minimum airflow necessary for the JW100C module is 0.75 m/s (150 ft./min.).

## **Thermal Considerations** (continued)

### **Custom Heat Sinks**

A more detailed model can be used to determine the required thermal resistance of a heat sink to provide necessary cooling. The total module resistance can be separated into a resistance from case-to-sink ( $\theta_{cs}$ ) and sink-to-ambient ( $\theta_{sa}$ ) shown below (Figure 33).

8-1304 (C)

**Figure 33. Resistance from Case-to-Sink and Sink-to-Ambient**

For a managed interface using thermal grease or foils, a value of  $\theta_{cs} = 0.1 \text{ } ^\circ\text{C/W}$  to  $0.3 \text{ } ^\circ\text{C/W}$  is typical. The solution for heat sink resistance is:

$$\theta_{sa} = \left[ \frac{(T_C - T_A)}{P_D} \right] - \theta_{cs}$$

This equation assumes that all dissipated power must be shed by the heat sink. Depending on the user-defined application environment, a more accurate model, including heat transfer from the sides and bottom of the module, can be used. This equation provides a conservative estimate for such instances.

### **Layout Considerations**

Copper paths must not be routed beneath the power module mounting inserts.

## Outline Diagram

Dimensions are in millimeters and (inches).

Tolerances:  $x.x \text{ mm} \pm 0.5 \text{ mm}$  ( $x.xx \text{ in.} \pm 0.02 \text{ in.}$ )  
 $x.xx \text{ mm} \pm 0.25 \text{ mm}$  ( $x.xxx \text{ in.} \pm 0.010 \text{ in.}$ )
