#### **TOP VIEW**

# **CURRENT MODE** REGULATING **PULSE WIDTH MODULATORS**

## **FEATURES**

- Guaranteed ±1% reference voltage tolerance
- Guaranteed ±10% frequency tolerance
- Low start-up current (<500 μA)
- · Under voltage lockout with hysteresis
- · Output state completely defined for all supply and input conditions
- Interchangeable with UC1842 and UC1843 series for improved operation
- 500kHz operation

D-14 Package - 14 Pin Plastic (150) SOIC

#### **DESCRIPTION**

The IP1842 and IP1843 series of switching regulator control circuits contain all the functions necessary to implement off-line, current mode switching regulators, using a minimum number of external parts. Functions included are voltage reference, error amplifier, current sense comparator, oscillator, totem pole output driver and under-voltage lockout circuitry.

Although pin compatible with the UC1842 and 1843 series, SEMELAB has incorporated several improvements in the IP1842 and IP1843 series allowing tighter and more complete specification of electrical performance.

#### **BLOCK DIAGRAM**

#### RECOMMENDED OPERATING CONDITIONS

| $\overline{V_{CC}}$ | Supply Voltage <sup>1</sup>         |                | ≤ 30V        |
|---------------------|-------------------------------------|----------------|--------------|
| IO                  | Output Current                      |                | 0 to ±200mA  |
|                     | Analog Inputs (pins 2 and 3)        |                | -0.3V to 3V  |
|                     | Error Amp Output Sink Current       |                | 0 to 2mA     |
|                     |                                     | IP1842, IP1843 | −55 to 125°C |
|                     | Operating Ambient Temperature Range | IP2842, IP2843 | −25 to 85°C  |
|                     |                                     | 0 to 70°C      |              |

#### Notes:

1. Lower limit set by under voltage lockout specification.

## **NOTES**

1. Test Conditions unless otherwise stated:  $V_{CC}=15V^*\;,\;R_T=10k\Omega\;,\;C_T=3.3nF\;,\;f=52kHz.$  \*Adjust  $V_{CC}$  above start threshold before setting at required level.

All specifications apply over the full operating temperature range unless otherwise stated.

(See Ordering Information for further details).

- 2. Parameter measured at trip point of latch with  $V_{\text{PIN2}} = 0V$
- 3. Gain defined as:

$$A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}}$$
$$0 \le V_{PIN3} \le 0.8$$

(Coo Oracimig imprimation for farmor dotaile).

#### APPLICATIONS INFORMATION

#### **Oscillator Waveforms and Maximum Duty Cycle**

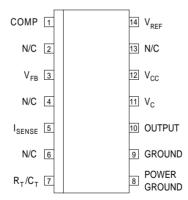

Oscillator timing capacitor  $C_T$  is charged by  $V_{REF} \ t_c \approx 0.55 \ R_T C_T$ through R<sub>T</sub> and discharged by an internal current source. During the discharge time, the internal clock signal  $t_d \approx R_T C_T \ln \left( \frac{.0063 R_T - 2.3}{.0063 - 4} \right)$ blanks the output to the low state. Selection of  $\ensuremath{R_{T}}$  and  $C_T$  therefore determines both oscillator frequency and Resultant frequency  $f = \frac{1}{(t_c + t_d)}$ maximum duty cycle. Charge and discharge times are determined by the formulae:

$$t_d \approx R_T C_T \ln \left( \frac{.0063 R_T - 2.3}{.0063 - 4} \right)$$
  
Resultant frequency  $f = \frac{1}{(t_c + t_d)}$ 

For  $R_T > 5k\Omega$ ,

Resultant frequency  $f \approx \frac{1.8}{(R_T C_T)}$ 

## **Open-Loop Laboratory Test Fixture**

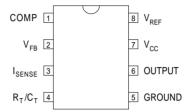

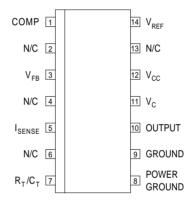

High peak current associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5K potentiometer are used to sample the oscillator wave form and apply an adjustable ramp to pin 3.
