High-Speed, Precision DIFFERENCE AMPLIFIERS

FEATURES

- DESIGNED FOR LOW COST
- SINGLE, DUAL VERSIONS
- LOW OFFSET VOLTAGE DRIFT:
 $\pm 450\mu\text{V}$ max, $\pm 5\mu\text{V}/^\circ\text{C}$ max
- LOW GAIN ERROR: 0.05% max
- WIDE BANDWIDTH: 1.5MHz
- HIGH SLEW RATE: $5\text{V}/\mu\text{s}$
- FAST SETTLING TIME: $5.5\mu\text{s}$ to 0.01%
- LOW QUIESCENT CURRENT: $950\mu\text{A}$
- WIDE SUPPLY RANGE: $\pm 2.25\text{V}$ to $\pm 18\text{V}$
- SO-8 and SO-14 PACKAGES

DESCRIPTION

The INA133 and INA2133 are high slew rate, unity-gain difference amplifiers consisting of a precision op amp with a precision resistor network. The on-chip resistors are laser trimmed for accurate gain and high common-mode rejection. Excellent TCR tracking of the resistors maintains gain accuracy and common-mode rejection over temperature. They operate over a wide supply range, $\pm 2.25\text{V}$ to $\pm 18\text{V}$ ($+4.5\text{V}$ to $+36\text{V}$ single supply), and input common-mode voltage range extends beyond the positive and negative supply rails.

APPLICATIONS

- DIFFERENTIAL INPUT AMPLIFIER BUILDING BLOCK
- DIFF IN/DIFF OUT AMPLIFIER
- UNITY-GAIN INVERTING AMPLIFIER
- GAIN = $+1/2$ OR $G = +2$ AMPLIFIER
- SUMMING AMPLIFIER
- SYNCHRONOUS DEMODULATOR
- CURRENT/DIFFERENTIAL LINE RECEIVER
- VOLTAGE-CONTROLLED CURRENT SOURCE
- BATTERY POWERED SYSTEMS
- LOW COST AUTOMOTIVE

The differential amplifier is the foundation of many commonly used circuits. The low cost INA133 and INA2133 provide this precision circuit function without using an expensive precision network.

The single version, INA133, package is the SO-8 surface mount. The dual version, INA2133, package is the SO-14 surface mount. Both are specified for operation over the extended industrial temperature range, -40°C to $+85^\circ\text{C}$. Operation is from -55°C to $+125^\circ\text{C}$.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Supply Voltage, $V+$ to $V-$	36V
Input Voltage Range	$2 \cdot V_S$
Output Short-Circuit (to ground) ⁽²⁾	Continuous
Operating Temperature	-55°C to $+125^\circ\text{C}$
Storage Temperature	-55°C to $+125^\circ\text{C}$
Junction Temperature	$+150^\circ\text{C}$
Lead Temperature (soldering, 10s)	$+300^\circ\text{C}$

NOTES: (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. (2) One channel per package.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION

PRODUCT	PACKAGE	PACKAGE DRAWING NUMBER ⁽¹⁾	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER ⁽²⁾	TRANSPORT MEDIA
Single						
INA133U	SO-8 Surface Mount	182	-40°C to $+85^\circ\text{C}$	INA133U	INA133U	Rails

SMALL-SIGNAL STEP RESPONSE

LARGE-SIGNAL STEP RESPONSE

MAXIMUM OUTPUT VOLTAGE vs FREQUENCY

APPLICATIONS INFORMATION

The INA133 and INA2133 are high-speed difference amplifiers suitable for a wide range of general purpose applications. Figure 1 shows the basic connections required for operation of the INA133. Decoupling capacitors are strongly recommended in applications with noisy or high impedance power supplies. The capacitors should be placed close to the device pins as shown in Figure 1. All circuitry is completely independent in the dual version assuring lowest crosstalk and normal behavior when one amplifier is overdriven or short-circuited.

As shown in Figure 1, the differential input signal is connected to pins 2 and 3. The source impedances connected to the inputs must be nearly equal to assure good common-mode rejection. A 5Ω mismatch in source impedance will degrade the common-mode rejection of a typical device to approximately 80dB (a 10Ω mismatch degrades CMR to 74dB). If the source has a known impedance mismatch, an additional resistor in series with the opposite input can be used to preserve good common-mode rejection.

The INA133's internal resistors are accurately ratio trimmed to match. That is, R_1 is trimmed to match R_2 and R_3 is trimmed to match R_4 . However, the absolute values may not be equal ($R_1 + R_2$ may be slightly different than $R_3 + R_4$). Thus, large series resistors on the input (greater than 250Ω), even if well matched, will degrade common-mode rejection.

Circuit board layout constraints might suggest possible variations in connections of the internal resistors. For instance, it appears that pins 1 and 3 could be interchanged. However, because of the ratio trimming technique used (see paragraph above) CMRR will be degraded. If pins 1 and 3 are inter-

FIGURE 1. Precision Difference Amplifier (Basic Power Supply and Signal Connections).

changed, pins 2 and 5 must also be interchanged to maintain proper ratio matching.

OPERATING VOLTAGE

The INA133 and INA2133 operate from single (+4.5V to +36V) or dual ($\pm 2.25V$ to $\pm 18V$) supplies with excellent performance. Specifications are production tested with $\pm 5V$ and $\pm 15V$ supplies. Most behavior remains unchanged throughout the full operating voltage range. Parameters which vary significantly with operating voltage are shown in the Typical Performance Curves.

INPUT VOLTAGE

The INA133 and INA2133 can accurately measure differential signals that are above and below the supply rails. Linear common-mode range extends from $2 \cdot (V^+) - 3V$ to $2 \cdot (V^-) + 3V$ (nearly twice the supplies). See the typical performance curve, "Input Common-Mode Voltage vs Output Voltage."

OFFSET VOLTAGE TRIM

The INA133 and INA2133 are laser trimmed for low offset voltage and drift. Most applications require no external offset adjustment. Figure 2 shows an optional circuit for trimming the output offset voltage. The output is referred to the output reference terminal (pin 1), which is normally grounded. A voltage applied to the Ref terminal will be summed with the output signal. This can be used to null offset voltage as shown in Figure 2. The source impedance of a signal applied to the Ref terminal should be less than 10Ω to maintain good common-mode rejection.
