DESCRIPTION:

The IDT7187 is a 65,536-bit high-speed static RAM organized as 64K x 1. It is fabricated using IDT's high-performance, high-reliability technology, CEMOS. Access times as fast as 15ns are available with maximum power consumption of 880mW.

Both the standard (S) and low-power (L) versions of the IDT7187 provide two standby modes— I_{ss} and I_{ss1} . I_{ss} provides low-power operation (358mW max.); I_{ss1} provides ultra-low-power operation (5mW max.). The low-power (L) version also provides the capability for data retention using battery backup. When using a 2V battery, the circuit typically consumes only 30μW.

Ease of system design is achieved by the IDT7187 with full asynchronous operation, along with matching access and cycle times. The device is packaged in an industry standard 22-pin, 300 mil plastic or hermetic DIP, 24-pin plastic SOIC, 22- and 28-pin leadless chip carriers, or 24-pin flatpack or CERPACK.

Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

TIMING WAVEFORM OF WRITE CYCLE NO. 2, ($\overline{CS}$ CONTROLLED TIMING) (1, 2, 3, 4)

NOTES:

1. $\overline{WE}$ or $\overline{CS}$ must be high during all address transitions.
2. A write occurs during the overlap (t_{WP}) of a low $\overline{CS}$ and a low $\overline{WE}$.
3. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going high to the end of the write cycle.
4. If the $\overline{CS}$ low transition occurs simultaneously with or after the $\overline{WE}$ low transition, the outputs remain in the high impedance state.
5. Transition is measured ± 200 mV from steady state with a 5pF load (including scope and jig).
