HIGH-SPEED 1K x 9 DUAL-PORT STATIC RAM WITH BUSY

PRELIMINARY
IDT7010S/L
IDT70104S/L

FEATURES:

- High-speed access
 - Military: 35/45/55/70ns (max.)
 - Commercial: 25/35/45/55ns (max.)
- Low-power operation
 - IDT7010/70104S
 - Active: 400mW (typ.)
 - Standby: 7mW (typ.)
 - IDT7010/70104L
 - Active: 400mW (typ.)
 - Standby: 2mW (typ.)
- Fully asynchronous operation from either port
- Each port has a 9-bit wide data path. The 9th bit could be used as the parity bit.
- MASTER IDT7010 easily expands data bus width to 18 bits or more using SLAVE IDT70104 chip.
- On-chip port arbitration logic (IDT7010 only)
- BUSY output flag on MASTER; BUSY input on SLAVE
- Battery backup operation — 2V data retention
- TTL compatible, signal 5V ($\pm 10\%$) power supply
- Available in popular hermetic and plastic packages
- Military product compliant to MIL-STD-883, Class B

DESCRIPTION:

The IDT7010/IDT70104 are high-speed 1K X 9 dual-port static RAMs. The IDT7010 is designed to be used as a stand-

alone 9-bit dual-port RAM or as a "MASTER" dual-port RAM together with the IDT70104 "SLAVE" dual-port in 18-bit-or-more word width systems. Using the IDT MASTER/SLAVE dual-port RAM approach in 18-bit or wider memory system applications results in full-speed, error-free operation without the need for additional discrete logic.

Both devices provide two independent ports with separate control, address and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. An automatic power down feature controlled by $\overline{CE}$ permits the on-chip circuitry of each port to enter a very low standby power mode.

The devices utilize a 9-bit wide data path to allow for control/data and parity bits at the user's option. This feature is especially useful in data communications applications where it is necessary to use a parity bit for transmission/reception error checking.

Fabricated using IDT's CEMOS™ high-performance technology, these devices typically operate on only 400mW of power at maximum access times as fast as 25ns. Low-power (L) versions offer battery backup data retention capability with each port typically consuming 200μW from a 2V battery.

The IDT7010/IDT70104 devices are packaged in 48-pin sidebraced or plastic DIPs, 48-pin LCCs and 48-pin flatpacks. The military devices are processed 100% in compliance to the test methods of MIL-STD-883, Method 5004.

FUNCTIONAL BLOCK DIAGRAM

NOTE:

1. 7010 (MASTER): $\overline{BUSY}$ is totem-pole output.
70104 (SLAVE): $\overline{BUSY}$ is input.
2. Arbitration Logic is for IDT7010 (MASTER).

NOTE:

2651 10 10

1. This parameter is determined by device characterization but is not production tested.

2651 drw 11

The timing diagram illustrates the relationship between the ADDRESS, $\overline{CE}$, R/W, and DATA IN signals. The ADDRESS signal is shown as a high-level signal with a period t_{WC} . The $\overline{CE}$ signal is an active-low pulse with a width t_{AW} . The R/W signal is an active-low signal that transitions from high to low at the start of the data transfer and back to high at the end. The DATA IN signal is shown as a shaded rectangular pulse. Key timing parameters are labeled: t_{AS} (address setup time), t_{EW} (enable width), t_{WR} (write recovery time), t_{DW} (data write time), and t_{DH} (data hold time).

2651 drw 12

1. $R/\overline{W}$ must be high during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a low $\overline{CE}$ and a low $R/\overline{W}$.
3. t_{WR} is measured from the earlier of $\overline{CE}$ or $R/\overline{W}$ going high to the end of the write cycle.
4. During this period, the I/O pins are in the output state and input signals must not be applied.
5. If the $\overline{CE}$ low transition occurs simultaneously with or after the $R/\overline{W}$ low transition, the outputs remain in the high impedance state.
6. Transition is measured $\pm 500\text{mV}$ from steady state with a 5pF load (including scope and jig).
7. If $\overline{OE}$ is low during a $R/\overline{W}$ controlled write cycle, the write pulse width must be the larger of t_{WP} or $t_{WZ} + t_{OW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{OW} . If $\overline{OE}$ is high during a $R/\overline{W}$ controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .

FUNCTIONAL DESCRIPTION

The IDT7010/70104 provides two ports with separate control, address and I/O pins that permit independent access for reads or writes to any location in memory. The IDT7010/70104 has an automatic power down feature controlled by $\overline{CE}$. The $\overline{CE}$ controls on-chip power down circuitry that permits the respective port to go into a standby mode when not selected ($\overline{CE}$ high). When a port is enabled, access to the entire memory array is permitted. Each port has its own Output Enable control ($\overline{OE}$). In the read mode, the port's $\overline{OE}$ turns on the output drivers when set LOW. Non-contention READ/WRITE conditions are illustrated in Table I.

ARBITRATION LOGIC, FUNCTIONAL DESCRIPTION

The arbitration logic will resolve an address match or a chip enable match to 5ns minimum and determine which port has access. In all cases, an active $\overline{BUSY}$ flag will be set for the delayed port.

The $\overline{BUSY}$ flags are provided for the situation when both ports simultaneously access the same memory location. When this situation occurs, on-chip arbitration logic will determine which port has access and sets the delayed port's $\overline{BUSY}$ flag. $\overline{BUSY}$ is set at speeds that permit the processor to hold the operation and its respective address and data. It is important to note that the operation is invalid for the port that has $\overline{BUSY}$ set LOW. The delayed port will have access when $\overline{BUSY}$ goes inactive.

Contention occurs when both left and right ports are active and both addresses match. When this situation occurs, the on-chip arbitration logic determines access. Two modes of arbitration are provided: (1) if the addresses match and are

valid before $\overline{CE}$, on-chip control logic arbitrates between $\overline{CEL}$ and $\overline{CER}$ for access; or (2) if the $\overline{CE}$ s are low before an address match, on-chip control logic arbitrates between the left and right addresses for access (refer to Table II). In either mode of arbitration, the delayed port's $\overline{BUSY}$ flag is set and will reset when the port granted access completes its operation.

DATA BUS WIDTH EXPANSION, MASTER/SLAVE DESCRIPTION

Expanding the data bus width to eighteen-or-more-bits in a dual-port RAM system implies that several chips will be active at the same time. If each chip includes a hardware arbitrator, and the addresses for each chip arrive at the same time, it is possible that one will activate its $\overline{BUSY}_L$ while another activates its $\overline{BUSY}_R$ signal. Both sides are now busy and the CPUs will wait indefinitely for their port to become free.

To avoid this "Busy Lock-Out" problem, IDT has developed a MASTER/SLAVE approach where only one hardware arbitrator, in the MASTER, is used. The SLAVE has $\overline{BUSY}$ inputs which allow an interface to the MASTER with no external components and with a speed advantage over other systems.

When expanding dual-port RAMs in width, the writing of the SLAVE RAMs must be delayed, until after the $\overline{BUSY}$ input has settled. Otherwise, the SLAVE chip may begin a write cycle during a contention situation. Conversely, the write pulse must extend a hold time past $\overline{BUSY}$ to ensure that a write takes place after the contention is resolved. This timing is inherent in all dual-port memory systems where more than one chip is active at the same time.

The write pulse to the SLAVE should be delayed by the maximum arbitration time of the MASTER. If, then, a contention occurs, the write to the SLAVE will be inherited due to $\overline{BUSY}$ from the MASTER.

18-BIT MASTER/SLAVE DUAL-PORT MEMORY SYSTEMS

NOTE:

1. No arbitration in IDT70104 (SLAVE). $\overline{BUSY}$ -IN inhibits write in IDT70104 (SLAVE).

X	H	X	Z	CE _R = CE _L = H, Power Down Mode, ISB1 or ISB3
L	L	X	DATAin	Data on Port Written Into Memory ⁽²⁾
H	L	L	DATAout	Data in Memory Output on Port ⁽³⁾
H	L	H	Z	High Impedance Outputs

NOTES:

2651 t01 12

1. A_{0L} – A_{9L} ≠ A_{0R} – A_{9R}
2. If BUSY = L, data is not written.
3. If BUSY = L, data may not be valid, see twdd and tddd timing.
4. H = HIGH, L = LOW, X = DON'T CARE, Z = HIGH IMPEDANCE

TABLE II. ARBITRATION⁽¹⁾

Left Port		Right Port		Flags		Function
CE _L	A _{0L} – A _{9L}	CE _R	A _{0R} – A _{9R}	BUSYL	BUSYR	
H	X	H	X	H	H	No Contention
L	Any	H	X	H	H	No Contention
H	X	L	Any	H	H	No Contention
L	≠ A _{0R} – A _{9R}	L	≠ A _{0L} – A _{9L}	H	H	No Contention
Address Arbitration With CE Low Before Address Match						
L	LV5R	L	LV5R	H	L	L-Port Wins
L	RV5L	L	RV5L	L	H	R-Port Wins
L	Same	L	Same	H	L	Arbitration Resolved
L	Same	L	Same	L	H	Arbitration Resolved
CE Arbitration With Address Match Before CE						
LL5R	= A _{0R} – A _{9R}	LL5R	= A _{0L} – A _{9L}	H	L	L-Port Wins
RL5L	= A _{0R} – A _{9R}	RL5L	= A _{0L} – A _{9L}	L	H	R-Port Wins
LW5R	= A _{0R} – A _{9R}	LW5R	= A _{0L} – A _{9L}	H	L	Arbitration Resolved
LW5R	= A _{0R} – A _{9R}	LW5R	= A _{0L} – A _{9L}	L	H	Arbitration Resolved

2651 t01 13

NOTES:

1. X = DON'T CARE, L = LOW, H = HIGH
- LV5R = Left Address Valid ≥ 5ns before right address.
- RV5L = Right Address Valid ≥ 5ns before left address.

Same = Left and Right Addresses match within 5ns of each other.

LL5R = Left CE = LOW > 5ns before Right CE.

RL5L = Right CE = LOW ≥ 5ns before Left CE.

LW5R = Left and right CE = LOW within 5ns of each other.
