## LOW SKEW, 1-TO-24 DIFFERENTIAL-TO-LVCMOS FANOUT BUFFER

### GENERAL DESCRIPTION

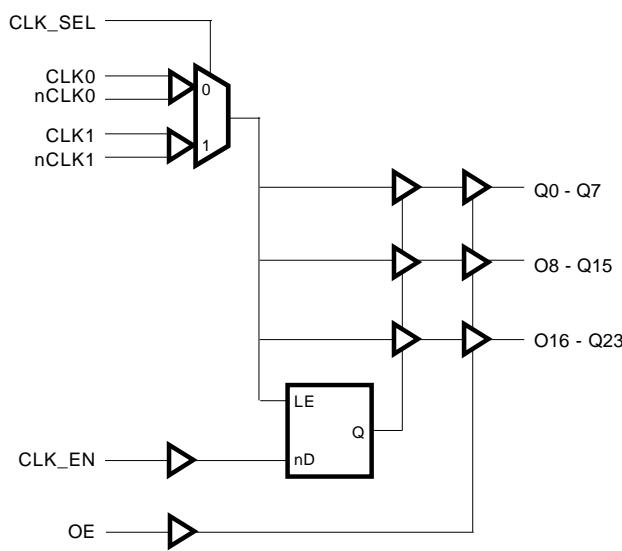

The ICS8344-01 is a low voltage, low skew fanout buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The ICS8344-01 is designed to translate any differential signal levels to LVCMOS levels. The low impedance LVCMOS outputs are designed to drive  $50\Omega$  series or parallel terminated transmission lines. The effective fanout can be increased to 48 by utilizing the ability of the outputs to drive two series terminated lines. Redundant clock applications can make use of the dual clock input. The dual clock inputs also facilitate board level testing. The output enable is synchronous which eliminates the runt clock pulses which occur during asynchronous enabling and disabling of the outputs. The outputs are driven low when disabled. The ICS8344-01 is characterized at full 3.3V, full 2.5V and mixed 3.3V input and 2.5V output operating supply modes.

Guaranteed output and part-to-part skew characteristics make the ICS8344-01 ideal for those clock distribution applications demanding well defined performance and repeatability.

NOTE 1: Single ended input use requires that one of the differential inputs be biased. The voltage at the biased input sets the switch point for the single ended input. For LVCMOS input levels the recommended input bias network is a resistor to VDDI, a resistor of equal value to ground and a 0.1µF capacitor from the input to ground. The resulting switch point is VDDI/2.
