NOTE:

1. An initial pause of 200 μ s is required after power-up followed by any 8 refresh ($\overline{\text{RAS}}$ only $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh) cycle before proper device operation is achieved.
2. If $\overline{\text{RAS}}=\text{V}_{\text{ss}}$ during power-up, the device could begin an active cycle. These condition results in higher current than necessary which is demanded from the power supply during power-up. It is recommended that $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ track with V_{cc} during power-up or be held at a valid V_{IH} in order to minimize the power-up current.
3. $\text{V}_{\text{IH}}(\text{min.})$ and $\text{V}_{\text{IL}}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between $\text{V}_{\text{IH}}(\text{min.})$ and $\text{V}_{\text{IL}}(\text{max.})$, and are assumed to be 5ns for all inputs.
4. Measured at $\text{V}_{\text{OH}}=2.0\text{V}$ and $\text{V}_{\text{OL}}=0.8\text{V}$ with a load equivalent to 2 TTL loads and 100pF.
5. These parameters define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
6. Either tr_{CH} or tr_{RH} must be satisfied for a read cycle.
7. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and $\overline{\text{WE}}$ leading edge in Read-Modify-Write cycles.
8. tw_{CS} , tr_{WD} , tc_{WD} , t_{AWD} and tcp_{WD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $\text{tw}_{\text{CS}} \geq \text{tw}_{\text{CS}}(\text{min.})$, the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle. If $\text{tr}_{\text{WD}} \geq \text{tr}_{\text{WD}}(\text{min.})$, $\text{tc}_{\text{WD}} \geq \text{tc}_{\text{WD}}(\text{min.})$, $\text{t}_{\text{AWD}} \geq \text{t}_{\text{AWD}}(\text{min.})$, and $\text{tcp}_{\text{WD}} \geq \text{tcp}_{\text{WD}}(\text{min.})$, the cycle is a Read-Modify-Write cycle and data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminated.
9. Operation within the $\text{tr}_{\text{CD}}(\text{max.})$ limit insures that $\text{tr}_{\text{AC}}(\text{max.})$ can be met. $\text{tr}_{\text{CD}}(\text{max.})$ is specified as a reference point only. If tr_{CD} is greater than the specified $\text{tr}_{\text{CD}}(\text{max.})$ limit, then access time is controlled by tc_{AC} .
10. Operation within the $\text{tr}_{\text{AD}}(\text{max.})$ limit insures that $\text{tr}_{\text{AC}}(\text{max.})$ can be met. $\text{tr}_{\text{AD}}(\text{max.})$ is specified as a reference point only. If tr_{AD} is greater than the specified $\text{tr}_{\text{AD}}(\text{max.})$ limit, then access time is controlled by t_{AA} .
11. $\text{t}_{\text{REF}}(\text{max.})=256\text{ms}$ is applied to SL-Parts (HY5117404BSLJ, HY5117404BSLT and HY5117404BSLR).
12. A burst of 2048 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycles must be executed within 64ms(256ms for SL-part) after exiting self refresh.
13. These specifications are applied to the test Mode.
14. If $\overline{\text{RAS}}$ goes high before $\overline{\text{CAS}}$ high going, the open circuit condition is achieved by $\overline{\text{CAS}}$ high going. If $\overline{\text{CAS}}$ goes high before $\overline{\text{RAS}}$ high going, the open circuit condition of the output is achieved by $\overline{\text{RAS}}$ high going.
15. $\text{t}_{\text{ASC}} \geq \text{tcp}(\text{min.})$, Assume $\text{tT}=2\text{ns}$

CAPACITANCE

($\text{T}_{\text{A}}=25^{\circ}\text{C}$, $\text{V}_{\text{cc}}=5\text{V} \pm 10\%$, $\text{V}_{\text{ss}}=0\text{V}$, $\text{f}=1\text{MHz}$, unless otherwise noted.)

TEST MODE

The HY511704B is a DRAM organized 4,194,304 x 4-bit. It is internally organized 1,048,576 x 16-bit. In Test Mode, data are written into 16 sectors (Each is composed of 1M bits) in parallel and retrieved the same way. Column address A0 and A1 are not used. If, upon reading, 4-bit data from 4 sectors connected to one DQ pin are equal (all "1"s or "0"s), the DQ pin indicates a "1". If they are not equal, the DQ pin indicates a "0". Belowing shows the timing diagram of the HY5117404B to enter Test Mode. In Test Mode, the 4M x 4 DRAM can be tested as if it were a 1M x 4 DRAM. WE, CAS-before-RAS cycle (Test Mode In Cycle) puts the HY5117404B into Test Mode and CAS-before-RAS or RAS-only refresh cycle puts it back into Normal Model. In Test Mode, WE, CAS-before-RAS cycle shall be used for the refresh operation. The Test Mode function refuces test time(1/4 in case of N test pattern).
