

DESCRIPTION

This family is a 16M bit dynamic RAM organized 2,097,152 x 8-bit configuration with Fast Page mode CMOS DRAMs. Fast Page mode is a kind of page mode which is useful for the read operation. The circuit and process design allow this device to achieve high performance and low power dissipation. Optional features are access time(60, 70 or 80ns) and refresh cycle(2K ref. or 4K ref.) and power consumption (Normal or Low power with self refresh). Hyundai's advanced circuit design and process technology allow this device to achieve high bandwidth, low power consumption and high reliability.

FEATURES

- Fast Page mode operation
- Read-modify-write Capability
- TTL compatible inputs and outputs
- /CAS-before-/RAS, /RAS-only, Hidden and Self refresh capability
- JEDEC standard pinout
- 28-pin Plastic SOJ (300mil)
- 28-pin plastic TSOP-II (300mil)
- Single power supply of 5.0V $\pm$ 10%
- Early write or output enable controlled write
- Max. Active power dissipation
- Fast access time and cycle time

Note

1. Icc1, Icc3, Icc4 and Icc6 depend on output loading and cycle rates(tRC and tPC).
2. Specified values are obtained with output unloaded.
3. Icc is specified as an average current. In Icc1, Icc3, Icc6, address can be changed only once while /RAS=VIL. In Icc4, address can be changed maximum once while /CAS=VIH within one Fast Page mode cycle time tPC.
4. Only /RAS(max.)=1μs is applied to refresh of battery backup but tRAS(max.) = 10 μs is to applied to normal functional operation.
5. Icc5(max.) = 200 μA, Icc7 and Icc8 are applied to SL-part only.

NOTE

1. An initial pause of 200 μ s is required after power-up followed by 8 /RAS only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 CBR refresh cycles instead of 8 /RAS-only refresh cycles are required.
2. VIH(min.) and VIL(max.) are reference levels for measuring timing of input signals. Transition times are measured between VIH(min.) and VIL(max.)
3. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range (TA=0 to 70; $^{\circ}$ C) is assured.
4. Measured at VOH=2.0V and VOL=0.8V with a load equivalent to 2TTL loads and 100pF.
5. Operation within the tRCD(max.) limit ensures that tRAC(max.) can be met. tRCD(max.) is specified as a reference point only. If tRCD is greater than the specified tRCD(max.) limit, then access time is controlled by tCAC.
6. Operation within the tRAD(max.) limit ensures that tRAC(max.) can be met. tRAD(max.) is specified as a reference point only. If tRAD is greater than the specified tRAD(max.) limit, then access time is controlled by tAA.
7. tOFF and tOEZ define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
8. Either tRCH or tRRH must be satisfied for a read cycle.
9. These parameters are referenced to /CAS leading edge in early write cycles and to /WE leading edge in read-modify-write cycles and late write cycle.
10. twCS, tRWD, tCWD, tAWD and tCPWD are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If twCS $\geq$ twCS(min.), the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle. If tRWD $\geq$ tRWD(min.), tCWD $\geq$ tCWD(min.), tAWD $\geq$ tAWD(min.), and tCPWD $\geq$ tCPWD(min.), the cycle is a read-modify-write cycle and data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
11. tASC, tCAH are referenced to the earlier /CAS falling edge.
12. tCP and tCPT are measured when /CAS is high state.
13. tCWD is referenced to the later /CAS falling edge at word read-modify-write cycle.
14. tCWL must be satisfied by /CAS for 8-bit access cycles.
15. tCSR is referenced to the earlier /CAS falling before /RAS transition low.
16. tCHR is referenced to the later /CAS rising high after /RAS transition low.
