

1 of 8 Decoded 8-Channel High Voltage Analog Switch

Ordering Information

| V_{PP} | V_{NN} | V_{SIG} | Package Options | | |
|----------|----------|-----------|-----------------------------------|-----------------------|--------------------|
| | | | 20-pin Ceramic Side-brazed DIP | 20-pin Plastic DIP | Die in waffle pack |
| +70V | -70V | 110V P-P | HV1514C | HV1514P | HV1514X |
| +80V | -80V | 130V P-P | HV1516C | HV1516P | HV1516X |

*Consult factory for Cerdip and Ceramic LCC availability.

Features

- HVCMOS® Technology
- Up to 130V peak to peak switching capability
- Output On-resistance typically 40 ohms
- Low parasitic capacitances
- DC to 10MHz analog signal frequency
- 45 dB typical output off isolation at 5 MHz
- CMOS logic circuitry for low power and excellent noise immunity
- On-chip decode, latch and chip select logic circuitry

Absolute Maximum Ratings*

| | |
|---------------------------------------|------------------------|
| V_{DD} logic power supply voltage | -0.5V to +18V |
| $V_{PP} - V_{NN}$ supply voltage | 174V† |
| V_{PP} positive high voltage supply | -0.5V to +90V† |
| V_{NN} negative high voltage supply | +0.5V to -90V† |
| Logic input voltages | -0.5 to V_{DD} +0.3V |
| Analog signal range | V_{NN} to V_{PP} |
| Peak analog signal current/channel | 1.5A† |
| Storage temperature | -65°C to +150°C |
| Power dissipation | 800mW |

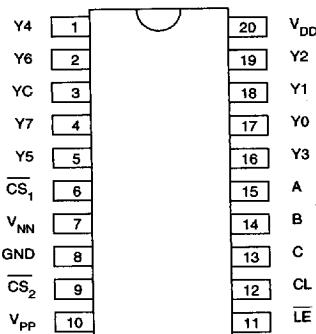

* Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability.

† For HV1516

General Description

This device is an 8-channel high-voltage integrated circuit (HVIC), configured as a 1 of 8 decode functions, intended for use in applications requiring high voltage switching controlled by low voltage signals; e.g., ultrasound imaging and printers. On-chip latches are provided for the decoded data. Using HVCMOS technology, this HVIC combines high voltage bi-lateral DMOS switches and low power CMOS logic to provide efficient control of high voltage analog signals.

Operating Conditions

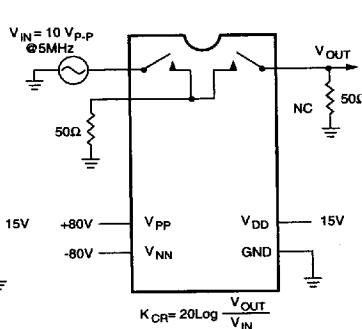

| Symbol | Parameter | Device | | Value |
|-----------|------------------------------------|--------|--------|----------------------------------|
| | | HV1514 | HV1516 | |
| V_{DD} | Logic power supply voltage | X | X | +10.0V to +15.5V |
| V_{PP} | Positive high voltage supply | X | | +50V to +70V |
| | | | X | +50V to +80V |
| V_{NN} | Negative high voltage supply | X | | -50V to -70V |
| | | | X | -50V to -80V |
| V_{IH} | High level input voltage | X | X | $V_{DD} - 2V$ to V_{DD} |
| V_{IL} | Low-level input voltage | X | X | 0 to 2.0V |
| V_{SIG} | Analog signal voltage peak to peak | X | X | $V_{NN} + 15V$ to $V_{PP} - 15V$ |
| T_A | Operating free air-temperature | X | X | 0° to 70°C |

Note:

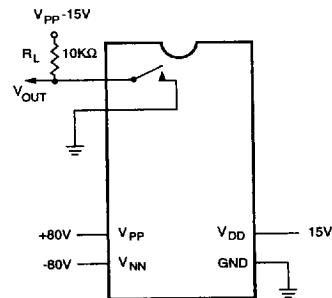

1. Power up/down sequence is arbitrary except GND must be powered-up first and powered-down last.

2. V_{SIG} must be $V_{NN} \leq V_{SIG} \leq V_{PP}$ or floating during power up/down transition.**Test Circuits**

Notes:

1. Address data at A, \overline{B} , C cause on of the eight switches to be selected for connection to the common bus C.
2. The clear input CL overrides all other inputs.
3. Since the latch follows the decoder, only the CL input matters when \overline{LE} is H.
4. The switches go to a state retaining their present condition at the rising edge of \overline{LE} . When \overline{LE} is low, the decoded selection address information flows through the latch.
