Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renesas Technology Corp.

The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Hitachi, Hitachi, Ltd., Hitachi Semiconductors, and other Hitachi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Renesas Technology Corp. Customer Support Dept. April 1, 2003

Cautions

Keep safety first in your circuit designs!

 Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- 1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
- 2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- 3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.

The information described here may contain technical inaccuracies or typographical errors. Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.

Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (http://www.renesas.com).

- 4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- 5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- 6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
- 7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.

Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.

8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

F-ZTAT Reprogramming by On-Chip CAN Application Note

Rev. 1.0 03/14/03 Hitachi, Ltd.

Cautions

- 1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
- 2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
- 3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
- 4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
- 5. This product is not designed to be radiation resistant.
- 6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
- 7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.

General Precautions on Handling of Product

- 1. Treatment of NC Pins
- Note: Do not connect anything to the NC pins.

The NC (not connected) pins are either not connected to any of the internal circuitry or are used as test pins or to reduce noise. If something is connected to the NC pins, the operation of the LSI is not guaranteed.

2. Treatment of Unused Input Pins

Note: Fix all unused input pins to high or low level.

Generally, the input pins of CMOS products are high-impedance input pins. If unused pins are in their open states, intermediate levels are induced by noise in the vicinity, a pass-through current flows internally, and a malfunction may occur.

- 3. Processing before Initialization
- Note: When power is first supplied, the product's state is undefined. The states of internal circuits are undefined until full power is supplied throughout the chip and a low level is input on the reset pin. During the period where the states are undefined, the register settings and the output state of each pin are also undefined. Design your system so that it does not malfunction because of processing while it is in this undefined state. For those products which have a reset function, reset the LSI immediately after the power supply has been turned on.
- 4. Prohibition of Access to Undefined or Reserved Addresses
- Note: Access to undefined or reserved addresses is prohibited. The undefined or reserved addresses may be used to expand functions, or test registers may have been be allocated to these addresses. Do not access these registers; the system's operation is not guaranteed if they are accessed.

Preface

This application note describes how to reprogram the flash memory using user program mode. The program data can be provided by using the on-chip HCAN (Hitachi Controller Area Network) of the H8S Series.

For details on the flash memory and HCAN, refer to the following sections in the H8S/2612F Hardware Manual.

- ROM
- HCAN

Although operations of programs and circuit examples, etc. described in this application note are confirmed, be sure to confirm them again before actual use. (Note that examples of programs in this application note are for the on-chip HCAN of the H8S/2612F.)

Section 1 Overview

This application note describes how to reprogram the H8S/2612F on-chip flash memory using user program mode. The program data can be provided by using the on-chip HCAN of the H8S/2612F.

As a sample system, this application note describes how to reprogram the flash memory in the system configuration shown in figure 1.1. Also this application note describes how to customize the programs shown in the application note according to the operating frequency and the CAN bus specifications for the user system.

Figure 1.1 Sample System Configuration

1.1 List of F-ZTAT^{TM*} Microcomputers (H8S Series) Including HCAN Unit

This application note applies to the following devices:

- H8S/2612F
- H8S/2623F
- H8S/2626F
- H8S/2636F

When using this application note as a reference for using microcomputers other than the H8S/2612F, note the differences in:

- Addresses, bit positions, and functionality of the on-chip registers
- Control method for erasing and programming the flash memory (such as application time for E and P bits)

Note: * F-ZTAT is a trademark of Hitachi, Ltd.

Rev. 1.0, 03/03, page 1 of 78

Renesas

1.2 Overview of User Program Mode

User program mode enables on-board reprogramming of the flash memory. This mode allows the user to reprogram the contents of the on-chip flash memory with the F-ZTAT microcomputer mounted on the user's board.

Two modes are available for on-board reprogramming of the flash memory: boot mode and user program mode. In boot mode, a boot program included in the F-ZTAT microcomputer is executed to implement programming to the flash memory. In user program mode, an application program in the flash memory (on-chip ROM) is executed. For this reason, user program mode requires the reprogram processing to be installed in the application program in advance.

Figure 1.2 Transition of User Program Mode

In boot mode, the on-chip boot program automatically erases the entire flash memory before new data is programmed. For this reason, a complete reprogramming of the application program is required even if the user only wants to reprogram it partially.

User program mode allows the user to erase and program any data according to the user system, allowing a partial reprogram for individual erased blocks.

Note: The word "program" of user program mode means "programming to" the flash memory.

1.3 Overview of Reprogramming Method in User Program Mode

Since the on-chip ROM is enabled in user program mode, the application program including the reprogram processing must be programmed to the on-chip flash memory in advance. Use boot mode or ROM programmer mode to perform this initial programming. If the reprogramming in user program mode is disabled due to accidental erasure of the application program including the reprogram processing, the user can forcibly program the data in boot mode.

Figure 1.3 Reprogramming Method in User Program Mode (Overview)

Rev. 1.0, 03/03, page 4 of 78

Section 2 Overview of Sample System

2.1 Hardware List

The following lists the components which are required for executing the sample program described in this application note.

Table 2.1Hardware List

No.	Hardware Name	Specifications	Remarks
1	Host (PC)	Executes FlashCAN.exe. Must	OS for DOS/V personal computers:
		have the serial interface.	Windows®* ¹ 98(S), Windows® 2000, Windows® NT4.0, Windows® Me, or Windows® XP
2	SCI-CAN communication conversion board	Converts serial communications from the host to CAN communications to communicate with the target board. It also converts CAN communications from the target board to serial communications.	LIN-CAN Starter Kit (H8S/2612F) manufactured by Hokuto Denshi co., Itd.
3	Target board	Contains on-board H8S/2612F that has the on-chip flash memory to which the data will be programmed.	LIN-CAN Starter Kit (H8S/2612F) manufactured by Hokuto Denshi co., ltd. requires a switch for the FWE pin to support user program mode.* ²
4	Serial cable	Connects the 9-pin host to the J3 connector on the SCI-CAN communication conversion board	Attached to the LIN-CAN Starter Kit (H8S/2612F) manufactured by Hokuto Denshi co., ltd.* ²
5	CAN bus cable	Connects the J7 connector on the 3-pin SCI-CAN communication conversion board to the J7 connector on the target board	Attached to the LIN-CAN Starter Kit (H8S/2612F) manufactured by Hokuto Denshi co., ltd.

Notes: 1. Windows® is a registered trademark of Microsoft Co., in the U.S. and other countries.

RENESAS

 A transition to user program mode requires turning on and off the FWE pin. The LIN-CAN Starter Kit (H8S/2612F) manufactured by Hokuto Denshi co., ltd. uses the slide switch (SW11) on the board to turn on and off the FWE pin. For actual operations on changing modes for the LIN-CAN Starter Kit (H8S/2612F), see the attached manual.

2.2 Software List

Table 2.2Software List

No.	File Name	Program Name	Remarks
1	FlashCAN.exe	F-ZTAT Microcomputer H-CAN Program	This program runs in the host (PC). It is an evaluation version for this application note.
2	SCI2612F3.sub	Program control program (SCI communications)	Use this program for the initial programming in boot mode. When executing this program, it should be sent from FlashCAN.exe to the boot program in the target board via serial transmission, and then store it in RAM.
3	HCAN2612F3.sub* ¹	Program/erase control program (HCAN communications)	Use this program for the reprogramming in user program mode. When executing this program, it should be sent from FlashCAN.exe to the processing included in the application on the target board via serial transmission, and then store it in RAM.
4	SCItoCAN.mot	SCI-CAN communication conversion program	This program runs in the SCI-CAN communication conversion board.
5	Sample1.mot*1	Application (sample) program	This program runs in the target board. This program includes the reprogram processing in user program mode.
Note	: * To use the sar system, you ca compile and a You do not ne changes.	nple program provided in an customize the items lis ssemble them. ed to customize anything	this application note according to the user sted below. Change the source files, and then if you use the sample system without any

2.3 Items to be Customized for Sample Program

No.	Items	Defaults	Se	ctions to Change
1	CAN communication settings	See the next page.	•	Sample1.mot
				InitHCAN() function in the HCAN_up.c file
2	Mailbox numbers for transmission and reception used by the on-chip HCAN	Receive: MB4	•	The following functions in the
		Transmit: MB5		Sample1.motHCAN_up.src file:
		ne		InitHCAN(), PowerON_Reset(), CAN_MB4_rcv1byte(), and CAN_MB5_trs1byte()
			•	•
				RCV1BYTE() and TRS1BYTE() subroutines in the HCAN2612f3.src file

Rev. 1.0, 03/03, page 6 of 78

To compile or assemble the program, use the batch file or Hew project of the DOS prompt. The attached batch file and Hew project found in the samples show an example of using the compiler package Ver. 5.0.02.

Change the following files according to the version of your compiler package.

- To change the HCAN2612f3.mot file, use the file HCAN2612f3.bat or Hew2.hws in the HCAN2612f3 folder.
- To change the Sample1.mot file, use the file Sample1.bat or Hew2.hws in the Sample1 folder.

2.4 Installing Programs to be Used in Application Note

Execute setup.exe to install the programs. The following shows the directory configuration after installation.

You can start up the program tool (FlashCAN.exe) from the Windows® Start menu as follows:

From the Start menu, select Programs, FlashCAN, and then FlashCAN.

2.5 CAN Bus Interface (Example)

A bus transceiver IC is necessary to connect this chip to a CAN bus. A Philips PCA82C250 transceiver IC is recommended. Any other product must be compatible with the PCA82C250. Figure 2.1 shows a sample connection diagram.

RENESAS

Table 2.3LED Pin Assignment

Microcomputer Pin	LED
PD0	D1
PD1	D2
PD2	D3
PD3	D4
PD4	D5
PD5	D6
PD6	D7
PD7	D8

The LED port is turned on by the bit of 0.

Rev. 1.0, 03/03, page 10 of 78

Section 3 Procedure for Reprogramming Flash Memory in User Program Mode

This application note uses the following procedure for reprogramming the flash memory:

- 1. Use the reception of a command via HCAN communication as a trigger to start the reprogramming of the flash memory.
- 2. Transfer the program/erase control program from outside to RAM via HCAN communication.
- 3. Switch the FWE pin on the target board (set FWE = 1 to enter user program mode).
- 4. Transfer the program data from outside via HCAN communication.

The hosts used in steps 1, 2, and 4 above are the host (PC) and SCI-HCAN communication conversion board.

3.1 Mapping Flash Memory for Application (Sample) Program

3.2 Programming Programs to Target Board and SCI-HCAN Communication Conversion Board

Before reprogramming the flash memory in user program mode, you need to program the programs in boot mode. Use 'Standard Mode' of FlashCAN.exe for programming in boot mode.

Renesas

Program the following programs in boot mode:

- Program Sample1.mot into the target board.
- Program SCItoCAN.mot into the SCI-HCAN communication conversion board.

For details on how to use FlashCAN.exe, see section 8.

Rev. 1.0, 03/03, page 13 of 78

3.3 CAN Communication Settings in Application Note

The application note requires the following settings for CAN communication:

CAN baud rate: 1000 kbps

(CPU operating frequency = 20 MHz and BCR setting = H'0034.)

- BRP setting: 0 (1 time quantum/ 2 system clocks)
- TSEG1 setting: 4 (5 time quanta)
- TSEG2 setting: 3 (4 time quanta)

This results in: 1 Mbps = 20 MHz/ $\{2 \times (0 + 1) \times (3 + 4 + 3)\}$ \uparrow \uparrow \uparrow BRP TSEG1 TSEG2

Data frame ID (standard format: 11 bits)

- Receive data ID on the communication conversion board: H'03F9 (11-bit display: 01111111001)
- Receive data ID on the target board: H'0602 (11-bit display: 1100000010)

Remarks:

The settings of SCI communication between the host (PC) and SCI-CAN communication conversion board should be as follows:

- Mode: Asynchronous communication method
- Data format: 8-bit data, without parity, one stop bit
- Bit rate: 57.600 bit/sec

Rev. 1.0, 03/03, page 16 of 78

Section 4 Reprogramming Flash Memory in User Program Mode

4.1 Initial State

Description:

- 1. Restart the H8S/2612F in user mode (MD0 = 1, MD1 = 1, MD2 = 1, and FWE = 0).
- 2. The application program initializes the HCAN unit to accept the conditions for entering the program processing.
- 3. Since the parameter data area has been erased in boot mode, the data is set to H'FF. The application program lights all the LEDs.
- Note: For details on how the application program operates the LEDs, see section 5.3, Application (Sample) Program.

4.2 Transferring Program/Erase Control Program

Description:

- 1. The host uses HCAN communication to issue a request to start the reprogram processing.
- 2. The application program accepts this request, and then enters the transfer processing of the program/erase control program.
- 3. The host transfers the program/erase control program.
- 4. The application program stores the program/erase control program to be transferred in RAM. After completion of the transfer, the application program jumps to the program/erase control program in RAM.
- 5. The user uses the switch on the target board to set the FWE pin to on (1). Setting FWE = 1 clears the hardware protect to enable erasing and programming of the flash memory.

RENESAS

Rev. 1.0, 03/03, page 18 of 78

4.3 Erasing Blocks of Flash Memory

Description:

- 1. The host uses HCAN communication to issue a request for erasing blocks in the area in which the new data is to be programmed.
- 2. The program/erase control program in RAM erases the requested blocks. However, the program in the initial state only executes erase-verify without executing erase because all blocks have been erased.

Renesas

4.4 **Programming New Application Program**

Description:

- 1. The host provides the program data (Data_00.mot) via HCAN communication.
- 2. The program/erase control program in RAM receives the program data and then programs it to the flash memory.
- 3. After the data has been programmed, set the FWE pin to off (0).
- 4. Restart the application program. Then, the application program refers to the parameter data (new data) and blinks the LEDs.

RENESAS

Note: For details on how the application program operates the LEDs, see section 5.3, Application (Sample) Program.

Rev. 1.0, 03/03, page 20 of 78

Section 5 Details of Software

5.1 F-ZTAT Microcomputer H-CAN Program

The F-ZTAT Microcomputer H-CAN Program (FlashCAN.exe) runs in the host (PC).

No.	File Name	Description
1	FlashCAN.exe	Main section of the F-ZTAT Microcomputer H-CAN Program
2	SCI2612F3.inf	Information file (for SCI communication) for the H8S/2612F microcomputer
3	SCI2612F3.sub	Load module of the program control program
4	HCAN2612F3.inf	Information file (for H-CAN communication) for the H8S/2612F microcomputer
5	HCAN2612F3.sub	Load module of the program/erase control program
6	HCAN2612F3.src	Source file of the program/erase control program
7	HCAN2612F3.bat	DOS prompt batch file that assembles and links the program/erase control program
8	Hew2.hws	Hew project file that assembles and links the program/erase control program

Example of the FlashCAN.exe window (Main window)

(Window for setting the CAN communication specifications)

5.2 SCI-HCAN Communication Conversion Program

The SCI-HCAN communication conversion program (SCItoCAN.mot) runs in the SCI-HCAN communication conversion board.

No.	File Name	Description
1	SCItoCAN.mot	On-chip load module for the H8S/2612F on the SCI-HCAN communication conversion board. This module converts the interface between the SCI and HCAN. It uses the on-chip SCI and HCAN for the H8S/2612F on the SCI-HCAN communication conversion board.

Note: Download the SCI-HCAN communication conversion program to the SCI-HCAN communication conversion board in boot mode in advance.

5.3 Application (Sample) Program

The application (sample) program (Sample1.mot) runs on the target board.

No.	File Name	Description
1	Sample1.mot	On-chip load module for the H8S/2612F on the target board. This module includes the flash-memory reprogram processing in user program mode. It provides the sample function that lights and blinks the LEDs to let you visually check the operation of the application.
2	Data_FF.motData_00.mot	Parameter data of the pattern by which the Sample1.mot lights and blinks the LEDs.
		H'FF (erased): Lights all the LEDs.
		H'00: Blinks the LEDs at one-second intervals.
3	HCAN_up.c	Sample1.mot source file that includes the flash-memory reprogram processing
4	Sample1.c	Sample1.mot source file that includes the function for lighting and blinking the LEDs
5	io_2612.h	Include file that defines the on-chip I/O register. This file has been included from HCAN_up.c and Sample.c.
6	Sample1.bat	DOS prompt batch file that compiles and links the program.
7	Hew2.hws	Hew project file that compiles and links the program.

Section 6 Example of Creating Application (Sample) Program

6.1 Functions and Variables

1. List of Functions

Source name: HCAN_up.c

Abbreviation	Module Name	Description
PowerON_Reset	Power-on reset processing	Performs initialization.
		This function checks whether the H command (0x48) is received, and then switches the user program processing and sample program.
UserProgramMode_Main	User program processing	Transfers the program/erase control program.
InitHCAN	HCAN initialization	Initializes HCAN communication.
CAN_MB5_trs1byte	Transmitting CAN one-byte	Transmits data (HCAN communication).
CAN_MB4_rcv1byte	Receiving CAN one-byte	Receives data (HCAN communication).

Source name: Sample1.c

Abbreviation	Module Name	Description
UserApli	LED display switching	Checks the parameters and controls the LEDs (lights or blinks all LEDs).

2. Variables

All the variables in use are internal variables.

6.2 Example of Changing CAN Communication Settings

 Change the bit rate from 1000 kbit/s to 500 kbit/s. In (1) HCAN.BCR.WORD = 0x0034;, change 0x0034 to 0x0134;. The baud rate prescaler is set to 4 system clocks, and the bit rate is set to 500 kbit/s. See the register description for BCR in the hardware manual.
 Change the data length from 1 byte to 8 bytes. In (2) HCAN.MC[4][1-1] = 0x01;, change 0x01; to 0x08;. The receive data length is set to 8 bytes. In (5) HCAN.MC[5][1-1] = 0x01;, change 0x01; to 0x08;. The transmit data length is set to 8 bytes. See the register description for MC0 to MC15 in the hardware manual.
 Change the receive mailbox ID from 0x0602 to 0x0005. In (3) HCAN.MC[4][5-1] = 0x20;, change 0x20; to 0xA0;. In (4) HCAN.MC[4][6-1] = 0x7F;, change 0x7F; to 0x005.
 In (6) HCAN.MC[4][6-1] = 0x7F;, change 0x7F; to 0x005.

In (6) HCAN.MC[5][5-1] = 0x40;, change 0x40; to 0x80;.

In (7) HCAN.MC[5][6-1] = 0xC0;, change 0xC0; to 0x00;.

The transmit mailbox ID (ID28 to ID18) is set to 0x0004.

See the register description for MC0 to MC15 in the hardware manual.

Program lists (1) to (3) Source name: HCAN_up.c Module name: InitHCAN

```
/* HCAN initialization
                                                                                        */
/* • Baud rate 1000kbps, TSEG1=4,TSEG2=3,BRP=0,SJW=0
                                                                                        * /
/* • MB4: Receiving "flash-memory reprogram request" [ID(11bit):03F9]
                                                                                        */
/* • MB5: Transmitting "flash-memory reprogram response" [ID(11bit):0602]

6.3 Example of Changing Receive and Transmit Mailbox Numbers for CAN Communications

Change the receive and transmit mailbox numbers (change [4] to [14] for the receive mailbox, and [5] to [15] for the transmit mailbox).

- Change the transmit/receive direction of the mailbox.
 In (1) HCAN.MBCR.WORD = 0x1100; change 0x1100; to 0x0140;.
 Only MBCR14 is set to 1, and only mailbox 14 is set for reception.
 See the register description for MBCR in the hardware manual.
- 2. Change the initialization for the mailbox.
 In (2), change for(j=4;j<=5;j++) to for(j=14;j<=15;j++){.
 Only mailboxes 14 and 15 will be initialized.
 See the register description for MC0 to MC15 and MD0 to MD15 in the hardware manual.
- 3. Change the settings for the mailbox.
 In (3) to (6), change HCAN.MC[4] to HCAN.MC[14].
 In (7) to (10), change HCAN.MC[5] to HCAN.MC[15].
 The receive mailbox [14] and transmit mailbox [15] are set.
 See the register description for MC0 to MC15 in the hardware manual.
- 4. Change the trigger receive processing.
 In (11), change if(HCAN.RXPR.BIT.RXPR4==1){ to if(HCAN.RXPR.BIT.RXPR14==1){.
 See the register description for RXPR in the hardware manual.
- 5. Change the receive processing.

In (12), change while(HCAN.RXPR.BIT.RXPR4==0); to

while(HCAN.RXPR.BIT.RXPR14==0);.

In (13) HCAN.RXPR.WORD=0x1000;, change 0x1000; to 0x0040;.

In (14), change return HCAN.MD[4][0] to return HCAN.MD[14][0];.

See the register description for RXPR and MD0 to MD15 in the hardware manual.

6. Change the transmit processing.

In (15), change HCAN.MD[5][0] to HCAN.MD[15][0].

In (16), change HCAN.TXPR.BIT.TXPR5 to HCAN.TXPR.BIT.TXPR15.

In (17), change while(HCAN.TXPR.BIT.TXPR5==0); to

while(HCAN.TXPR.BIT.TXPR15==0);.

In (18) HCAN.TXACK.WORD=0x2000;, change 0x2000; to 0x0080;.

See the register description for MD0 to MD15, TXPR, and TXACK in the hardware manual.

Section 7 Example of Creating Program/Erase Control Program

7.1 Overview

The following describes the calculation of the application time for the erase (E) and program (P) bits, and the wait time for the SWE bit. The parenthesized value indicates the unit.

- Calculation methods
 - 1. Time required for one cycle = $1 (sec) \div target clock (MHz)$
 - 2. Time required for one loop = Time required for one cycle (μ s) × number of cycles required for one loop
 - 3. Wait time = Target clock (MHz) \times stipulated wait time (μ s)
 - 4. Wait loop count = Wait time ÷ time required for one loop
 - 5. Wait time other than after setting of the P or E bit = Wait loop count + 1 (Since this wait time must be equal to or greater than the stipulated wait time, add 1 to the wait loop count obtained by the calculation.)
 - 6. Wait time after setting of the P or E bit = Wait loop count

(Since this wait time must be equal to or smaller than the stipulated wait time, use the wait loop count obtained by the calculation.)

• Expressions

The following shows examples of calculating the wait time:

Prerequisites: Target clock = 20 (MHz)

Number of cycles required for one loop = 4 (cycles)

Example 1: Obtain the wait time after the clearing of the SWE bit (100 μ s or longer).

- 1. $20 (MHz) \times 1000^* = 20000 (kHz)$
- 2. $20000 (\text{kHz}) \times 100 (\mu \text{s}) = 2000000$
- 3. $2000000 \div 4 \text{ (cycles)} \times 1000^* = 500 \text{ (times)}$
- 4. 500 (times) + 1 (time) = 501 (times)
- 5. WLOOP100 = 501
- 6. Time required for one cycle: 1 (sec) \div 20 (MHz) = 0.05 (μ s)
- 7. Time required for one loop: $0.05 (\mu s) \times 4 (cycles) = 0.2 (\mu s)$
- 8. Wait loop time: $0.2 (\mu s) \times 501 (times) = 100.2 (\mu s)$

Example 2: Obtain the wait time after the setting of the E bit (within 10 ms).

- 1. $20 (MHz) \times 1000^* = 20000 (kHz)$
- 2. $10000 (\mu s) \div 1000^* = 10 (ms)$

Rev. 1.0, 03/03, page 31 of 78

- 3. $20000 (\text{kHz}) \times 10 (\text{ms}) = 200000$
- 4. $200000 \div 4$ (cycles) = 50000 (times)
- 5. WTIME10000 = 50000
- 6. Time required for one cycle: 1 (sec) \div 20 (MHz) = 0.05 (μ s)
- 7. Time required for one loop: $0.05 (\mu s) \times 4 (cycles) = 0.2 (\mu s)$
- 8. Wait loop time: $0.2 (\mu s) \times 50000 (times) = 10000 (\mu s) = 10 (ms)$
- Note: * To minimize error, the above examples convert the unit of frequency from MHz to kHz to use the thousandfold values in calculation. Then, the results are divided by 1000 to obtain the correct count.
- 1. Erasing Flash Memory
 - (1) Erase

Erase functionality erases the flash memory block by block. To use erase, set 1 to the SWE bit in the flash memory control register (FLMCR), and then use the erase block register (EBR) to set one bit of the area in the flash memory to be erased. Then, set the ESU bit in FLMCR to prepare for erase mode (erase mode setup), and set the E bit in FLMCR to shift the operating mode to erase mode. The period of time during which the E bit is set is the erase time. After the erase time has elapsed, clear the E, ESU, and SWE bits in FLMCR to cancel erase mode.

(2) Erase-Verify

Erase-verify functionality verifies whether the flash memory has been erased successfully. To use erase-verify, set the SWE bit and then the EV bit in FLMCR to shift the operating mode to erase-verify mode. Before the flash memory is read in erase-verify mode, a dummy writing of data (H'FF) is performed on the address to be read. When the flash memory is subsequently read (the verify data is read in 16-bit units), the data at the latched address is read. If the read data has been erased (that is, all data is 1), a dummy writing of the next data is performed. Then erase-verify is performed for the next data. Upon completion of the verify operation, clear the EV and SWE bits in FLMCR to cancel erase-verify mode.

The following shows the wait time for each bit in FLMCR for erasing the flash memory.

Set or Clear Each Bit	Wait Time (Standard Value) Wait Time at 20 MHz		
SWE set	1 μs or greater	1.2 μs	
ESU set	100 μs or greater	100.2 μs	
E set	Up to 10 ms	10.0 ms	
E cleared	10 µs or greater	10.2 μs	
ESU cleared	10 μs or greater	10.2 μs	
EV set	20 µs or greater	20.2 µs	
Dummy write	2 µs or greater	2.2 μs	
EV cleared	4 μs or greater	4.2 μs	
SWE cleared	100 μs or greater	100.2 μs	
Maximum count	100 times	100 times	

Table 7.1 FLMCR Bits and Wait Time for Erasing Flash Memory

2. Programming Flash Memory

(1) Program

Program functionality programs data to the flash memory. One program is performed in 128-byte units. To use program, set 1 to the SWE bit in the flash memory control register (FLMCR). Then, the system stores the 128-byte program data in the program data area and reprogram data area, and then sequentially programs 128 bytes of data from the program data area in RAM to the target address (that is, byte-by-byte data transfer is sequentially performed 128 times). Note that the lower eight bits of the target start address must be H'00 or H'80. The program address and program data area latched in the flash memory.

A program of data of less than 128 bytes also requires a transfer of 128-byte data, for which data H'FF must be programmed to unnecessary address. Then, set the PSU bit in FLMCR to prepare for program mode (program mode setup), and set the P bit in FLMCR to shift the operating mode to program mode.

The period of time during which the P bit is set is the program time for the flash memory. After the program time has elapsed, clear the P, PSU, and SWE bits in FLMCR to cancel program mode. (Note that an additional program is performed for the programmed bits for up to the sixth initial program.)

(2) Program-Verify

Program-verify functionality verifies whether the flash memory has been programmed successfully. Set the SWE bit and then the PV bit in FLMCR to shift the operating mode to program-verify mode.

Before the flash memory is read in program-verify mode, a dummy writing of data (H'FF) is performed on the address to be read. When the flash memory is subsequently read (the verify data is read in 16-bit units), the data at the latched address is read. Then, the system compares the programmed data with the verify data, calculates the reprogram data, and then transfers the reprogram data to the reprogram data area. Upon completion of the verification of the data of 128 bytes, clear the PV and SWE bits in FLMCR to cancel program-verify mode.

The following shows the wait time for each bit in FLMCR for programming the flash memory. (Note that additional program data is calculated and transferred to the additional program data area for up to the sixth initial program.)

Set or Clear Each Bit	Wait Time (Standard Value)	Wait Time at 20 MHz
SWE set	1 μs or greater	1.2 μs
PSU set	500 μ s or greater	50.2 μs
P set (1st to 6th) (1st to 6th) additional (7th to 1000th)	Up to 30 μs Up to 10 μs Up to 200 μs	30.0 μs 10.0 μs 200.0 μs
P cleared	5 μs or greater	5.2 μs
PSU cleared	5 μs or greater	5.2 μs
PV set	20 μs or greater	20.2 µs
Dummy write	2 µs or greater	2.2 μs
PV cleared	2 μs or greater	2.2 μs
SWE cleared	100 μ s or greater	100.2 μs
Maximum count	1000 times	1000 times

Table 7.2 FLMCR Bits and Wait Time for Programming Flash Memory

7.2 Functions, Variables, and Constants

1. Functions

Source name: HCAN2612f3.src

Abbreviation	Module Name	Description
MAIN	Main processing	Receives the initialization target clock for the stack, receives a check command, and performs check. (W and C commands)
WLOOP_INI	Wait loop initialization processing	Initializes the wait loop.
WAITLOOP_CAL	Wait loop calculation main processing	Calculates and sets the wait loop.
WLOOP_CAL	Wait loop calculation processing	Calculates the wait loop.
WCMD	W command processing	Performs erase processing, program processing, and checksum processing
GET_EADR	Erase address receive processing	Receives the start address of the erase block.
BLK_CHECK	Specified block check processing	Checks the specified block.
GET_WADR	Program address receive processing	Receives the program address (four bytes).
GET_BUFFER	Program data receive processing	Receives the program data (128 bytes).
RCVNBYTE	N-byte receive processing	Receives N bytes of data.
RCV1BYTE	One-byte receive processing	Receives one byte of data.
TRS1BYTE	One-byte transmit processing	Transmits one byte of data.
XON_CHECK	XON check processing	Checks a response during program processing.
FWRITE128	Flash memory 128-byte program processing	Performs: Initial program and verify (for the first to the sixth program). Initial program, and program-verify (before the program). Additional program (for the first to the sixth program). Reprogram and program-verify (for the 7th to the 1000th program).

Abbreviation	Module Name	Description
FWRITEVF	Program-verify processing	Performs program-verify, creates reprogram data, and creates additional program data.
FWRITE	Flash memory program processing	Programs data to the flash memory.
BLK1_ERASE	One-block erase processing	Checks the specified block. Performs initial erase-verify (before the erasing). Erases data, and performs erase-verify (for the first to the 100th erase).
FERASEVF	Erase-verify processing	Performs erase-verify.
FERASE	Flash memory erase processing	Erases the flash memory.
CHECKSUM	Checksum processing	Calculates and transmits the checksum value (four bytes).

2. Variables

Abbreviation	Variable Name	Description	Size
W_ADR	Program address	Stores the program address.	4 bytes
W_BUF	Program buffer	Stores the program data.	128 bytes
BUFF	Buffer	Stores the reprogram data.	128 bytes
OWBUFF	Additional program buffer	Stores the additional program data.	128 bytes
COUNT	Counter	Counter for the number of times the erase count is programmed to the counter	2 bytes
EVF_ST	Erase start address	Stores the start address of the erase block.	4 bytes
EVF_ED	Erase end address	Stores the end address of the erase block.	4 bytes
BLK_NO	Erase specification block No.	Stores the erase specification block number.	1 byte
VF_RET	Verification result flag	Result of erase-verify and program-verify	1 byte
RESTSIZE	Program data size	Stores the program data size.	4 bytes
E_ADR	Erase block address	Stores the erase block address.	64 bytes
E_ADR_PTR	Erase block address pointer	Pointer to the erase block address.	4 bytes
WORKCLK	Clock	Stores the target clock.	4 bytes
ERASEBLOCK	Erase block count	Stores the number of erase blocks.	1 byte
WLOOP1	Wait 1 µ	Stores the loop count for the 1 $\ensuremath{\mu s}$ wait.	2 bytes
WLOOP2	Wait 2 µ	Stores the loop count for the 2 μ s wait.	2 bytes

Rev. 1.0, 03/03, page 36 of 78

Abbreviation	Variable Name	Description	Size
WLOOP4	Wait 4 μ	Stores the loop count for the 4 μs wait.	2 bytes
WLOOP5	Wait 5 μ	Stores the loop count for the 5 μs wait.	2 bytes
WLOOP10	Wait 10 µ	Stores the loop count for the 10 μs wait.	2 bytes
WLOOP20	Wait 20 μ	Stores the loop count for the 20 μs wait.	2 bytes
WLOOP50	Wait 50 μ	Stores the loop count for the 50 μs wait.	2 bytes
WLOOP100	Wait 100 μ	Stores the loop count for the 100 μs wait.	2 bytes
WTIME10	Program wait 10 μ	Stores the loop count for the 10 μ s wait during an additional program.	4 bytes
WTIME30	Program wait 30 μ	Stores the loop count for the 30 μ s wait during an initial program.	4 bytes
WTIME200	Program wait 200 μ	Stores the loop count for the 200 μs wait during a reprogram.	4 bytes
WTIME1000	Erase wait loop 10 m	Stores the loop count for the 10 ms wait during erasing.	4 bytes

7.3 Example of Changing Receive and Transmit Mailbox Numbers for CAN Communications

Change the receive and transmit mailbox numbers (change [4] to [14] for the receive mailbox, and [5] to [15] for the transmit mailbox).

1. Change the registers and bits.

Add the following definitions for the registers and bits in (1) to (9):

(1) F	RXPR14_MOV	.EQU	H'0040
(2) F	RXPR_L	.EQU	H'FFF80F
(3) F	RXPR14	.EQU	6
(4) N	MD14_0	.EQU	H'FFF920
(5) N	MD15_0	.EQU	H'FFF928
(6) 7	TXPR_L	.EQU	H'FFF807
(7) 1	TXPR15	.EQU	7
(8) 7	TXACK15	.EQU	7
(9) 7	TXACK15_MOV	.EQU	H'0080

See the register description for RXPR, TXPR, TXACK, and MD0 to MD15 in the hardware manual.

2. Change the settings of receive processing.

In (10) and (11), change RXPR4 to RXPR14.

In (10), change RXPR to RXPR_L.

In (12), change MD4_0 to MD14_0.

In (13), change RXPR4_MOV to RXPR14_MOV.

See the register description for RXPR and MD0 to MD15 in the hardware manual.

3. Change the settings of transmit processing.

In (14), change MD5_0 to MD15_0.

In (15) and (17), change TXPR to TXPR_L.

In (16), (18), and (19), change TXPR5 to TXPR15.

In (20), change TXACK5_MOV to TXACK15_MOV.

See the register description for TXPR, TXACK, and MD0 to MD15 in the hardware manual.

Section 8 Functions and Operations of On-Board Programming Tool and SCI-HCAN Communication Conversion Program

For details on the on-board programming tool, see the F-ZTAT Microcomputer On-Board Writing Program Manual.

8.1 Installing On-Board Programming Tool

1. Start Setup.exe.

 Select the language you want to use and click the OK button. (Click the Cancel button to cancel the installation of the tool.)

InstallShield Wizard					
FlashCAN Setup is preparing the InstallShield® Wizard, which wil guide you through the rest of the setup process. Please wait.					
	Cancel				

(Click the Cancel button to cancel the installation of the tool.)

3. Click the Next button to continue the installation of the tool.

(Click the Cancel button to display the Confirm dialog box to cancel the installation of the tool.)

4. Select the destination folder where you want to install the tool.

(To change the destination folder, click the Browse button to select another folder.)

InstallShield Wizard		×
Choose Destination Location Select folder where Setup will install files.		
Setup will install FlashCAN in the following fold	er.	
To install to this folder, click Next. To install to another folder.	a different folder, click Browse :	and select
Destination Folder C:\FlashCAN		Browse
InstallShield		
	< <u>B</u> ack [<u>N</u> ext>	Cancel

5. Click the Next button.

(Click the Back button to return to step 3.)

(Click the Cancel button to display the Confirm dialog box to cancel the installation of the tool.)

InstallShield Wizard
Select Program Folder Please select a program folder.
Setup will add program icons to the Program Folder listed below. You may type a new folder name, or select one from the existing folders list. Click Next to continue.
Program Folders:
FlashCAN
Existing Folders:
Accessones Administrative Tools
FlashCAN
Startup
InstallShield
< <u>B</u> ack <u>N</u> ext > Cancel

6. Select a program folder and click the Next button.

(Click the Back button to return to step 3.)

(Click the Cancel button to display the Confirm dialog box to cancel the installation of the tool.)

7. The setup status of the tool appears.

(Click the Cancel button to display the Confirm dialog box to cancel the installation of the tool.)

8. The wizard appears to indicate the completion of the installation. Click the Finish button.

Now, the on-board programming tool is installed completely.

Select the Start, Programs, and FlashCAN menu, and then the FlashCAN shortcut menu to start the on-board programming tool.

• Confirm dialog box to cancel the installation of the tool

Click the Yes button to cancel the installation of the tool.

Click the No button to continue the installation.

• Confirm dialog box to uninstall the tool

Start Setup.exe to uninstall the installed tool.

Confirm File Deletion	×
Do you want to completely remove the sel	ected application and all of its components?
OK]	Cancel

Click the OK button and follow the wizard to uninstall the tool.

Click the Cancel button to cancel the uninstallation of the tool.

8.2 First Programming of Application (Sample) Program to Target Board

- 1. Use the serial cable to connect the personal computer to the target board. (In this application note, the serial cable is connected to COM1.)
- 2. Turn the target board on.
- 3. Place the target board in boot mode.
- 4. Start FlashCAN.exe.

The version information (for a working sample) appears.

5. Click the OK button to display the main window.

Rev. 1.0, 03/03, page 51 of 78

9. Click the Change/Set button for the clock and bit rate to make settings.

Clock and Communica	tion Setting	×
Input clock*	20.0000 MHz	Clock mode
Bit rate	57,600 bit/s 💌	
Serial port	СОМ1 💌	* Set the frequency of the input clock or the crystal oscillator.
Time out (1 - 300sec.)	5 sec.	OK Cancel

10. Set the input clock to 20.0000 MHz.

The input clock can be set between 4 MHz and 20 MHz as specified in the SCI2612F3.inf file.

11. Select 1 for the clock ratio.

The clock ratio can be selected from among 1, 2, and 4 as specified in the SCI2612F3.inf file.

12. Select 57600 bit/s (bit rate) for the serial communication.

The bit rate can be selected from among 2400, 4800, 9600, 19200, 38400, 57600, 115200, and None.

13. Select COM1 for the serial port.

Either COM1 or COM2 can be selected.

Alternatively, you can directly enter any serial port name.

14. Set the timeout value to 5.

The timeout value can be set between 1 and 300.

15. Click the OK button to return to the main window.

(Click the Cancel button to return to the main window without changing the settings.)

RENESAS

Rev. 1.0, 03/03, page 55 of 78

28. Confirm the checksum and click the OK button to return to the main window.

Now, the application (sample) program is completely programmed into the target board for the first time.

Restarting the target board initiates the application (sample) program.

Since the parameter is set to 0xFF, all the LEDs light up.

8.3 Programming SCI-HCAN Communication Conversion Program to SCI-HCAN Communication Conversion Board

1. Use the serial cable to connect the personal computer to the SCI-HCAN communication conversion board.

(In this application note, the serial cable is connected to COM1.)

- 2. Turn the SCI-HCAN communication conversion board on.
- 3. Place the SCI-HCAN communication conversion board in boot mode.
- 4. Follow steps 4 to 16 in section 8.2, First Programming of Application (Sample) Program to Target Board.
- 5. Select the write data file SCItoCAN.mot in step 17 in section 8.2.

Write and Erase Se	etting	×
File name	C:\FlashCAN\SCItoCAN\SCItoCAN.mot	
Start address	3 00000000 - Search	
End address	0001FFFF 	
Offset	0	
🗖 Erase befo	ore write	
[OK Cancel	

6. Follow steps 18 to 21 in section 8.2.

13. Confirm the checksum and click the OK button to return to the main window.

Now, the SCI-HCAN communication conversion program is completely programmed into the SCI-HCAN communication conversion board.

Restarting the SCI-HCAN communication conversion board initiates the SCI-HCAN communication conversion program.

8.4 Reprogramming Flash Memory in User Program Mode

1. Use the serial cable to connect the personal computer to the SCI-HCAN communication conversion board.

(In this application note, the serial cable is connected to COM1.)

- 2. Use the CAN cable to connect the target board to the SCI-HCAN communication conversion board.
- 3. Turn the SCI-HCAN communication conversion board on.
- 4. Turn the target board on.
- 5. Place the SCI-HCAN communication conversion board in user mode.
- 6. Place the target board in user mode (by resetting the target board).
- 7. Start FlashCAN.exe.

The version information (for a working sample) appears.

Yersion	×
This software is a working sample.	
Please use this for evaluation only.	
(OK)	

8. Click the OK button to display the main window.

Stop	

45. The status of the write processing appears.

(Click the Stop button to stop the write processing and return to the main window.)

46. The processing completes and the checksum appears.

End	×	
H-CAN Write Confirm the checl	complete ksum	
Flash memory PC	007E2845	
<u>OK</u>		

47. Confirm the checksum and click the OK button to return to the main window.

Now, the flash memory is completely reprogrammed in user program mode.

Restarting the target board initiates the application (sample) program.

Since the parameter is set to 0x00, all the LEDs blink.

8.5 Error Messages for FlashCAN.exe (Additional Messages for HCAN)

1. Error dialog box

The Error dialog box appears if an error occurs.

Check an error message, and then click the OK button.

2. List of error messages

No. 319	Information file: Incorrect specification of H-CAN.	
Description	An incorrect HCAN is specified in the information (INF) file.	
No. 650	Transmit-ID was illegally specified.	
Description	An illegal transmit ID (transmit mailbox ID) is specified.	
No. 651	Receive-ID was illegally specified.	
Description	An illegal receive ID (receive mailbox ID) is specified.	
No. 652	Transmit-ID/Receive-ID was illegally specified.	
Description	The transmit ID (transmit mailbox ID) and receive ID (receive mailbox ID) are identical.	
No. 653	TSEG2 was illegally specified.	
Description	An illegal TSEG2 (time segment 2) is specified.	
No. 654	TSEG1 was illegally specified.	
Description	An illegal TSEG1 (time segment 1) is specified.	
No. 800	H-CAN Setup error.	
Description	An error is detected during communication of the H command.	
	The host side received NAK (0x07) and this caused the HCAN setup error.	
No. 801	H-CAN Setup error. (confirmation error)	
Description	An error is detected during communication of the H command.	
	The host side received a signal other than ACK (0x06) and NAK (0x07) and this caused the HCAN setup error.	
No. 802	H-CAN Setup error. (time out)	
Description	An error is detected during communication of the H command.	
	The host side could not receive any signal and this caused the timeout. The HCAN setup failed.	
No. 803	H-CAN Send clock error.	
Description	An error is detected during transmission with the HCAN frequency.	
	The host side received NAK (0x07) and this caused the transmission error.	
No. 804	H-CAN Send clock error. (confirmation error)	
Description	An error is detected during transmission with the HCAN frequency.	
	The host side received a signal other than ACK (0x06) and NAK (0x07) and this caused the transmission error.	
No. 805	H-CAN Send clock error. (time out)	
Description	An error is detected during transmission with the HCAN frequency.	
	The host side could not receive any signal and this caused the timeout. The transmission failed.	

Section 9 Supplementary Description

9.1 Required Items for Reprogramming Flash Memory in User Program Mode

To reprogram the flash memory in user program mode, the user must provide the following methods. The shaded section in the table indicates the method used in this application note.

1. Items required for user board

No.	User Must Provide:	Method Examples
1	Method for programming in boot mode: This method switches user mode to boot mode, and vice versa. It also provides program data from the SCI_2.	Mode switch and SCI_2 connector
2	Method for switching the FWE pin by hardware: This method switches user mode to user program mode, and vice versa.	Mode switch
Note	Bo not always apply a high level voltage to the FWE pir when the CPU is not accessing the flash memory.	n. Be sure to switch the FWE pin
2.	Items that application must include	
No.	User Must Provide:	Method Examples
1	Method for transition to the flash-memory reprogram processing: This method accepts a trigger for starting the flash- memory reprogram processing, and then jumps to the reprogram processing.	FWE pin level sense, external interrupt, command reception by SCI, or command reception by HCAN, etc.
2	Method for transferring the program/erase control program to RAM: A program in RAM must control the programming and erasing of the flash memory. To satisfy this condition, this method transfers the program/erase control program to RAM, and then jumps to the transferred program.	Transfer from ROM to RAM, transfer from outside using SCI, or transfer from outside using HCAN, etc.

3. Items required by host

No. User Must Provide:

1	Program/erase control program: This program is a Motorola-type load module. Use the program/erase algorithm that is recommended by the hardware manual. The user must also install the transfer function that matches the host to receive instruction or response for erase blocks, or the program data.	The program added to FDT.exe, added to FlashCAN.exe, or created yby the user, etc.
2	Method for providing the program data (host): A host that controls the sequences shown in the above table and transfers the program data is necessary.	FDT.exe, FlashCAN.exe, or user- created tool, etc.

Method Examples

9.2 Differences between User Program Mode and Boot Mode

Two types of modes are available for on-board reprogramming of the flash memory: the user program mode and boot mode. The following shows the differences between these modes.

ltem	User Program Mode	Boot Mode
Execution of application program	The application program downloaded in the flash memory is executed. Reprogramming the flash memory in user program mode requires the reprogram processing to be included in this application program in advance.	The application program downloaded in the flash memory is not executed. Instead, the on- chip boot program in the F-ZTAT microcomputer is executed.
Interface used for reprogramming of flash memory	The user can select the interface according to the user system. Examples of available interfaces are the SCI and HCAN.	Use the SCI. The F-ZTAT microcomputer automatically adjusts the communication rate. The protocol is fixed.
Transfer destination of program/erase control program	The whole RAM area from H'FFE000 to H'FFEFBF (4032 bytes) are available.	Transfer the program to RAM address from H'FFE800 to H'FFEFBF (1984 bytes).
Erase block	The user can select any block to erase. The user must provide the program that controls the erasing of the flash memory (erase control program) and transfer it to RAM.	The F-ZTAT microcomputer automatically erases all the blocks.
Programming	Reprogramming is possible in units of erase blocks. Data can be programmed only for the erased blocks. The user must provide the program that controls the programming of the flash memory (program control program) and transfer it to RAM.	Since all the blocks are erased, the user must program data to the entire flash memory. The user must provide the program that controls the programming of the flash memory (program control program) and transfer it to RAM.

ltem	User Program Mode	Boot Mode
Method of mode transition	Two methods are available: Reset the system with the settings $MD0 = 1$, MD1 = 1, $MD2 = 1$, and $FWE = 1$; or During execution with $MD0 = 1$, $MD1 = 1$, MD2 = 1, and $FWE = 0$ in user mode, switch the setting to $FWE = 1$. This method enables reprogramming the flash memory without resetting the user system.	Reset the system with the settings MD0 = 1, MD1 = 1, MD2 = 0, and FWE = 1.

9.3 How to Measure Application Time for E and P Bits

Erasing and programming the flash memory is implemented by setting the E and P bits in FLMCR to apply a voltage. The hardware manual describes the voltage application time.

Setting too short application time for the E or P bit disables the erasing or programming. Setting too long application time causes excessive erasing or excessive programming, which leads to the permanent damage on the device. When setting the E and P bits, set up the on-chip watchdog timer to prevent a program runaway.

The sample program in this application note controls the application time for the E and P bits by adjusting the software loop count. Therefore, you need to increase or reduce the loop count according to the operating frequency. You can obtain the time required for the software loop by using calculation and simulator debugger. However, the application time for the E and P bits is so important that we recommend you actually measure these bits from outside.

To measure the E and P bits, output high/low voltage for the E and P bits to the on-chip I/O port. Output a signal to the on-chip I/O port at the same timing as setting the E and P bits to high and low. Use an oscilloscope or logic analyzer to measure the output signal of the on-chip I/O port from outside.

Source example: Output on/off of the P bit to the on-chip I/O port P00.

;====== WRITE pulse application ====================================
