Monolithic CMOS

Serial Interface COFIDEC Family

77C 09211

DT-75-11-09

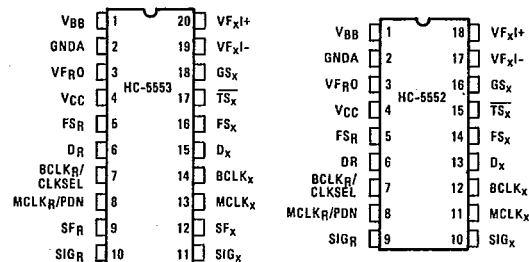

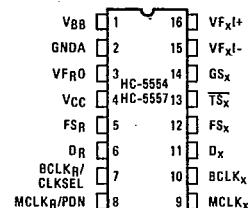

4302271 HARRIS SEMICONDUCTOR

**Features**

- Complete CODEC/FILTER (COFIDEC) Family
- HC-5552 -  $\mu$ -Law with Short Frame Signaling (18 Pin)
- HC-5553 -  $\mu$ -Law with Both Short and Long Frame Signaling (20 Pin)
- HC-5554 -  $\mu$ -Law without Signaling (16 Pin)
- HC-5557 -  $\mu$ -Law (16 Pin)
- Low Operation Power (60mW Typical)
- Low Standby Power (1mW Typical)
- $\pm 5V$  Power Supplies
- Meets or Exceeds all D3/D4 and CCITT Specifications
- TTL or CMOS Compatible Digital Interfaces
- PCM Data Serial Input/Output
- Synchronous or Asynchronous Operation
- Automatic Power-Down

**Pinouts**

TOP VIEW

DUAL-IN-LINE PACKAGE

**Description**

The CODEC/FILTER (COFIDEC) family includes A-Law and  $\mu$ -Law monolithic CODEC/FILTERS implemented with double-poly CMOS technology.

**The transmit side of the device consists of:**

- ▶ an amplifier with external gain adjustment
- ▶ an RC active prefilter to eliminate high frequency noise
- ▶ a switched capacitor band-pass filter including a notch filter at 55Hz to reject signals below 200Hz and above 3400Hz
- ▶ a change redistribution coder which samples and encodes filtered signal in the companded  $\mu$ -Law or A-Law PCM format
- ▶ a precision voltage reference
- ▶ an internal auto-zero network to cancel the transmit offset

**The receive side of the device consists of:**

- ▶ an expanding decoder (A-Law or  $\mu$ -Law) to reconstruct the analog signal
- ▶ a switched-capacitor low-pass filter which corrects for the  $\sin x/x$  response of the decoder output and rejects signals above 3400Hz
- ▶ an RC active filter followed by a single ended power amplifier able to drive a 600X load
- ▶ a precision voltage reference

The PCM word is transmitted/received in a serial format compatible with industry standard.

The device is operated with two (transmit and receive) master clocks (1.536MHz, 1.544MHz or 2.048MHz) which may be asynchronous.

Also required are transmit and receive bit clock which may vary from 64KHz to 2.048MHz and transmit and receive frame sync pulses.

**Functional Description HC-5552/53/54/57****Power Up/Power Down**

The COFIDEC is automatically placed into the power-down mode when  $V_{CC}$  and  $V_{BB}$  are applied to the circuit. All the analog blocks are de-activated and the  $D_X$  and  $V_{FRO}$  outputs are in their high impedance state.

When a low level or a clock is applied on  $MCLK_R$ , the COFIDEC powers up.

During the first two frames, the  $D_X$  output is in the high impedance state. To compensate rapidly for the offset of the transmit section, the auto-zero circuit is in quick capture mode during the first 512 frames and the input of the low pass filter is set to zero during the first 256 frames. When a high level is applied on  $MCLK_R$ , the device goes into power down mode.

**Transmit Section**

The input of the transmit section is an operational amplifier whose gain can be externally adjusted. This amplifier exhibits low noise, wide bandwidth and low offset voltage (1mV typical). The input amplifier drives an anti-aliasing RC active filter. The switched capacitor band-pass filter is split into a 5th order elliptic low-pass filter and a 3rd order elliptic high-pass filter which includes a 55Hz notch filter to guarantee excellent line (50 or 60Hz) rejection. The structure of each filter is fully differential so that their performance is not affected by parasitic elements.

The A/D converter is of a companding type according to A (HC-5557) or  $\mu$  (HC-5552/53/54) coding laws.

**Receive Section**

The receive section includes an expanding D/A converter according to A (HC-5557) or  $\mu$  (HC-5552/53/54) coding laws. The decoder is followed by a 5th order switched capacitor low-pass filter and an RC active filter.

As for the transmit part, the filters are fully differential. The output amplifier has a unity gain and can drive a 600 $\Omega$ /500pF load.

Separately trimmed voltage references are provided for transmit and receive sections respectively. Clocking circuits and internal power supplies are also fully independent. This arrangement greatly reduces crosstalk between the transmit and receive blocks and improves performance.

**Synchronous Operation**

A low level on  $MCLK_R$  input presets the circuit into synchronous mode. In this case,  $MCLK_X$  and  $BCLK_X$  are used for both transmit and receive sections, and  $BCLK_R$  is used as a master clock select. A high level or open circuit selects the normal frequency and a low level selects the alternate frequency (See Table 1 below).

**TABLE 1.**

BCLKR/CLKSEL	HC-5557	HC-5552/53/54
Clock	2.048MHz	1.544/1.536MHz
Low	1.536/1.544MHz	2.048MHz
High or Open	2.048MHz	1.536/1.544MHz

The bit clock  $BCLK_X$  may vary from 64KHz to 2.048MHz provided that  $BCLK_X$  is synchronous with  $MCLK_X$ . For 1.544MHz operation, the device automatically compensates for the 193rd clock pulse of each frame.

**Asynchronous Operation**

Two asynchronous modes are allowed with excellent transmission performance:

1 $\phi$ /  $MCLK_R$  is fully independent of  $MCLK_X$  and must be 2.048MHz for HC-5557 (A law) and 1.544 or 1.536MHz for HC-5552/53/54 ( $\mu$  law) (freq  $MCLK_X$  = freq  $MCLK_R$   $\pm$  50ppm).

2 $\phi$ / If required,  $MCLK_X$  can also be used as a master clock for both transmit and receive sections ( $MCLK_X$  input connected externally to  $MCLK_R$  input).

In both modes,  $BCLK_X$  and  $BCLK_R$  may operate from 64KHz to 2.048MHz.  $BCLK_X$  must be synchronous with  $MCLK_X$ , but  $BCLK_R$  may be asynchronous with  $MCLK_R$  (freq  $BCLK_R$  = freq  $MCLK_R$   $\pm$  50ppm).

The degradation of the signal to total distortion ratio under all permitted asynchronous conditions does not exceed 0.5dB as compared to the same measurement made with fully synchronous clocks.

**Data Acquisition and Transmission**

In both short and long frame operation, when  $FS_X$  is high, the first  $BCLK_X$  rising edge enables the  $D_X$  buffer and shifts the sign bit out. The other bits are shifted out with the 7 following rising edges of  $BCLK_X$ . The falling edge of the 8th  $BCLK_X$  pulse disables the  $D_X$  buffer.

Similarly, when  $FS_R$  is high, the first  $BCLK_R$  rising edge enables the PCM word to be latched in from  $D_R$  input with the 8 following falling edges of  $BCLK_R$ .

**Detection of Short or Long Frame Operation**

A long frame of short frame operation is detected by sensing  $FS_X$  on the 3rd rising edge of  $BCLK_X$  after  $FS_X$  low to high transition. At this time, if a high level is sensed on  $FS_X$ , a long frame operation is detected.

Upon power up a short frame operation is assumed.

**Signaling**

In transmission, the signaling bit provided by  $SIG_X$  input is latched by the 8th  $BCLK_X$  rising edge after  $FS_X$  low to high transition and inserted in place of the LSB of the PCM word during the frame.

In reception, the signaling bit is extracted from the PCM word (LSB) in the receive register and transferred to  $SIG_R$  output. The data at  $SIG_R$  output will be held until next signaling frame. At the same time the decoder compensates for the loss of the LSB by setting the LSB to 1/2 to minimize noise and distortion.

\* In SHORT frame, the COFIDEC senses a signaling frame when  $FS_X$  ( $FS_R$ ) is still high during the 1st falling edge of  $BCLK_X$  ( $BCLK_R$ ) after  $FS_X$  ( $FS_R$ ) low to high transition.

\* In LONG frame, the frame sync pulses  $FS_X$  and  $FS_R$  are 3 or more bit clock periods long. A signaling frame is identified from  $SF_X$  and  $SF_R$  for transmit and receive sections respectively.  $SF_X$  ( $SF_R$ ) must be high for 3 or more  $BCLK_X$  ( $BCLK_R$ ) periods for a signaling frame and stay low for a non signaling frame.

NOTE: Transmit and Receive Sections must be both in LONG frame or both in SHORT frame.

HC-5553 can be used for both short and long frame signaling. For short frame use,  $SF_X$  and  $SF_R$  should be tied low or left open circuit.

HC-5552 is intended for short frame application only. Signaling is not possible with HC-5554 or HC-5557.

TFB	Fall Time Bit Clock	TPB = 488ns			50	ns
<b>Frame Sync Pulses</b>						
TSFB	Frame Sync High Set up before 1st Bit Clock rising		50			ns
THOLD	Frame Sync Low Hold after Bit Clock rising		50			ns
TWFH	Width of Frame Sync High		100			ns
TSFBS	Frame Sync Low Set up before 1st Bit Clock falling	Short Frame without Signaling	100			ns
THFBS	Frame Sync High Hold after 1st Bit Clock falling	Short Frame with Signaling	100			ns
TSFBL	Frame Sync Low Set up before 3rd Bit Clock rising	Short Frame with Signaling	100			ns
THFBL	Frame Sync High Hold after 3rd Bit Clock rising	Long Frame	100			ns
TWFL	Width of Frame Sync Low	Long Frame and 64KBit/s	100			ns
TSSFB	SF <sub>X/R</sub> Set up before 1st Bit Clock rising	Long Frame Signaling	0			ns
THSFB	SF <sub>X/R</sub> Hold after 3rd Bit Clock rising	Long Frame Signaling	100			ns
<b>Data</b>						
TDBXE	Delay from 1st Bit Clock rising to TS <sub>X</sub> Low	Load = 150pF + 2 LSTTL loads	20		140	ns
TDBXZ	Delay from 8th Bit Clock falling to TS <sub>X</sub> disabled		50		165	ns
TDBDE	Delay from 1st Bit Clock rising to Data output enabled	Load = 150pF + 2 LSTTL loads	20		165	ns
TDBD	Delay from Bit Clock rising to Data output valid	Load = 150pF + 2 LSTTL loads			180	ns
TDBDZ	Delay from 8th Bit Clock falling to Data output disabled		50		165	ns
TSSGB	SIG <sub>X</sub> , Set up before 8th Bit Clock rising		50			ns
THSGB	SIG <sub>X</sub> , Hold after 8th Bit Clock rising		100			ns
TSDB	Data input Set up before Bit Clock falling		50			ns
THDB	Data input Hold after Bit Clock falling		50			ns
TDBSG	Delay from 8th Bit Clock falling to SIG <sub>R</sub> valid	Load = 50pF + 2 LSTTL loads	300			ns

## Timing Diagrams

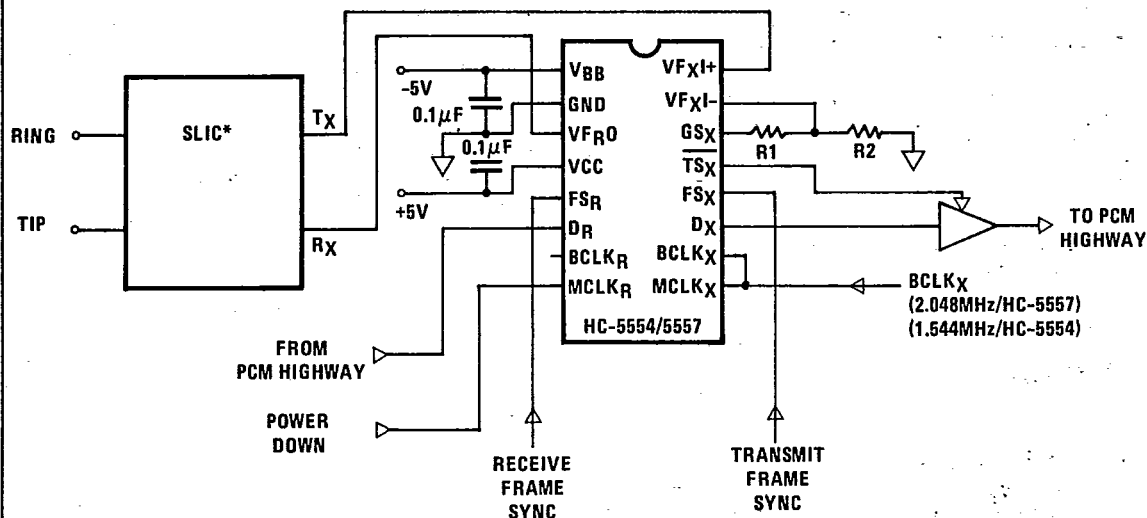

## Operating Instructions

Ground should be applied to the device before any other connection. Although  $V_{CC}$  and  $V_{BB}$  can be connected in any order, one should check that voltages on all inputs and on supply rails stay within absolute maximum ratings even for very short periods to avoid any latch-up. All ground connections to each device should meet at a common point as close as possible to the GND pin.

Two  $0.1\mu\text{F}$  decoupling capacitors are required from the common ground point to  $V_{CC}$  and  $V_{BB}$ .

The ground point of each COFIDEC should be tied to a common card ground in star formation, rather than via a ground bus.

### TYPICAL SYNCHRONOUS APPLICATION

**NOTICE:**

Harris Semiconductor's products are sold by description only. Harris Semiconductor reserves the right to make changes in circuit design and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders.

For maintenance of performance and reliability, Harris Semiconductor strongly recommends that the "I.C. Handling Procedures", located in Section 1 of the current Analog Products Data Book, be followed closely by any activity involved with I. C Products.
